

Nerves

Tim Hems¹

¹The Victoria Infirmary, NHS Greater Glasgow and Clyde, Glasgow, United Kingdom

The hand depends on the nerves which innervate it to convey sensory information to the central nervous system and to control movement. The importance of the nerve supply of the hand is reflected in a relatively large area of sensory and motor cortex. Nerves can be affected by many disorders including injury and compression neuropathies. This section includes chapters on nerve structure and anatomy, the effects of injury and compression, management and outcome of nerve injuries, and compression neuropathies in the upper limb.
