### ★ Indicates a change from the 2024 List of MAK and BAT Values

Details of the new limit values or classifications proposed are listed in the list of MAK values and classifications and assessment values in biological material reviewed in 2024/2025 (appendix page I). The Commission has adopted these proposals but puts them up for discussion until 31.12.2025. New data or scientific commentary may be submitted to the Commission's scientific office (Kommissionssekretariat) until this date. This information will be examined and taken into consideration in the final ratification.

# Maximum Concentrations at the Workplace

# I. Significance, use and derivation of MAK values

#### **Definition**

The MAK value ("maximale Arbeitsplatzkonzentration": maximum workplace concentration) is defined as the maximum concentration of a chemical substance (as gas, vapour or aerosol) in the workplace air which generally does not have known adverse effects on the health of the employee nor cause unreasonable annoyance (e. g. by a nauseous odour) even when the person is repeatedly exposed during long periods, usually for 8 hours daily but assuming on average a 40-hour working week. As the MAK value is intended for a daily exposure period of 8 hours, the permissible concentration should be reduced if exposure regularly exceeds 8 hours<sup>1</sup>). Certain aspects of occupational hygiene associated with liquid substances, e.g. formation of mist with obscured visibility, dampening of clothing, or condensation on the floor, can not be taken into account in establishing the MAK value. Such effects have a wide range of variation, depending on the industrial process, the procedure, and the physical conditions at the workplace. A suitable instrument for evaluation is not yet available. Regardless of the level of the toxicologically based MAK value, it should be ensured in these cases that safety at the workplace is not placed at risk. This situation is not explicitly mentioned in the documentations because it is not known whether the substance exists as an aerosol at the MAK value. As a rule, the MAK value is given as an average concentration for a period of up to one working day or shift. MAK values are established on the basis of the effects of chemical substances; when possible, practical aspects of the industrial processes and the resulting exposure patterns are also taken into account. Scientific criteria for the prevention of adverse effects on health are decisive, not technical and economic feasibility. Furthermore,

the carcinogenicity (see Section III)
the sensitizing effects (see Section IV)
the contribution to systemic toxicity after percutaneous absorption (see Section VII)
the risks during pregnancy (see Section VIII)
the germ cell mutagenicity (see Section IX)

of a substance are evaluated and the substance classified or designated accordingly. Descriptions of the procedures used by the Commission in the evaluation of these end points may be found in the appropriate sections of the List of MAK and BAT Values, in "The MAK Collection for Occupational Health and Safety" and in scientific journals 3)4)5)6)7).

In line with the so-called "preferred value approach" also used e. g. in the European Union, MAK values are to be established preferentially as the numerical values 1, 2 or 5 ml/m $^3$  or, for non-volatile substances, 1, 2 or 5 mg/m $^3$ , multiplied by powers of ten.

In the use of MAK values, the analytical procedures used for sampling and analysis and the sampling strategy are of great importance.

# **Purpose**

MAK values promote the protection of health at the workplace. They provide a basis for judgement of the toxic potential or safety of the concentrations of substances in the workplace air. However, they do not provide constants from which the presence or absence of a health hazard after longer or shorter periods of exposure can be determined; nor can proven or suspected damage to health be deduced, in an isolated case, from MAK values or from the classification of a substance as carcinogenic. Such deductions can be made only on the basis of medical findings, taking into consideration all the circumstances of the particular case. On principle, statements in the List of MAK and BAT Values are therefore not to be seen as a priori judgements for individual cases and observation of MAK Values does not eliminate the necessity for regular medical examination of the exposed individuals.

MAK values are not suitable for providing constant conversion factors for deduction of health risks associated with long-term exposure to contaminants in the non-occupational atmosphere, e. g., in the vicinity of industrial plants.

# **Prerequisites**

In principle, the substances are dealt with according to their importance for practical occupational hygiene and the expertise of the members of the Commission. The prerequisite for the establishment of a MAK value is the availability of sufficient data for the substance from the fields of toxicology, occupational medicine or industrial hygiene. Adequate documentation is not always available. The list is revised annually and suggestions for substances to be added and new information on listed substances are welcome<sup>8</sup>).

#### **Derivation of MAK values**

MAK values are derived by the "Permanent Senate Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area of the DFG" exclusively on the basis of scientific arguments and are published in the List of MAK and BAT Values which is issued annually. For the derivation of MAK values, certain rules of procedure have been developed by the Commission on the basis of established toxicological and occupational medical concepts; answers to at least the more common questions are repeatedly sought in the same way. Therefore, the usual procedures and the general principles for the derivation of MAK values are described below. Essentially, these principles correspond with those published by the European "Scientific Committee on Occupational Exposure Limits, SCOEL").

First, the most sensitive parameters described in the available data are to be identified, i. e., those effects which appear first during exposure to increasing concentrations of the substance. To be taken into account in this process are both local effects, that is, the results of effects on surfaces of the organism which are in contact with the environment (e. g. mucous membranes of the respiratory tract and the eyes, skin) and also systemic effects, that is, the results of uptake of the substance into the organism. Generally, the concentration-effect relationships for these two kinds of effects are different. The derivation of the MAK value is based on the "no observed adverse effect level" for the most sensitive effect with relevance for health. A NOAEL is not equivalent with a threshold which cannot be scientifically defined. The NOAEL is a concentration determined by experimental conditions at which the given effect is so low that it does not differ from the control value. It must be decided whether or not such effects may be considered to be adverse effects. At present there is no generally accepted definition for an "adverse" effect, at least in part because of the lack of clarity about the still changing definition for the state of being "healthy" (1); therefore, this decision must be made anew in every case.

Fundamentally, known effects of a substance in man are given highest priority in the derivation of the MAK value.

In the evaluation of a substance, known effects of structural analogues may also be taken into account.

If no NOAEL may be derived from the available data, a scientifically founded MAK value cannot be established and the substance is listed in Section IIb of the List of MAK and BAT Values.

#### a) Selection, collection of data and procedure for evaluating the statistical methods

For the substances being studied, the epidemiological data published in scientific journals, occupational medical reports, toxicological properties and any other potentially useful information is first assembled by carrying out researches in appropriate databanks. The references found in the literature search are checked for their relevance for the assessment of the substance in question and the original publications of the selected literature are examined. When necessary, unpublished internal company data in the form of complete study reports are also included. These are then identified as such in the reference list at the end of the documentation. The validity of the available information and studies is checked. Whether or not a study is relevant for the current assessment, is decided on a case to case basis. Whenever possible, evaluation of the studies is based on the guidelines of the OECD or similar bodies.

The unabridged reports are made available to the Commission and are filed at the Commission's scientific central office. Information required by a third party about the company reports cited in the Commission's documentation is supplied in writing by the chair of the Commission at own discretion. Access to company reports is not made available to third parties. Copies, even of parts of reports, are not provided.

#### ★ Procedure for evaluating the statistical methods in cited studies

Information for evaluating whether the cited toxicological and animal studies used suitable statistical methods and tests to assess the data collected is provided by OECD Guidance Document 116<sup>12</sup>). Chapter 4 of this guidance document describes the most common statistical methods and offers guidance on their correct use for the assessment of data for toxicity, including carcinogenicity.

More complex methods of statistical analysis are generally required for the statistical evaluation of epidemiological data. These are often mathematical models (regression models). Biostatistical procedures are evaluated using modern epidemiological methods<sup>13</sup>) as well as recommendations for assessing the direction and magnitude of potential bias<sup>14</sup>).

Generally, the main focus of the evaluation is to determine the validity and precision of the results of the cited studies. The validity of the results is assessed by taking into account the potential bias typical for a particular study design and any bias relevant to the scope of the study. The precision is analysed based on statistical data for confidence intervals, standard deviations or the level of significance. The results of these evaluations are augmented by expert judgements to assess the meaningfulness of the study ("study informativeness"); both are documented in the scientific evaluation.

#### b) Values based on effects in man

For many substances encountered at the workplace, irritation or central nervous depression is the critical effect. Valuable information – at least for these acute effects of single exposures – may be obtained from studies of volunteers exposed under controlled conditions which yield data for concentration-effect relationships and also for concentrations without effects (NOAEC). A detailed review of the methods required of such studies and of the usefulness of various parameters for the establishment of limit values has been published<sup>15</sup>). Such studies often demonstrate differences in sensitivity between persons who have never been exposed to the test substance and those who have been repeatedly exposed, e. g., at work.

Occupational medical and epidemiological studies provide further information from which the health risks associated with handling particular substances may be evaluated. However, not only the parameters determined in the exposed persons, but also any differences in study design, in the analytical methods and sampling strategies must be considered in evaluating such studies. Various confounders, exposure to mixtures, previous disorders or inadequate exposure records can alter or falsify any detected concentration-effect relationships.

<sup>15)</sup> DFG (Deutsche Forschungsgemeinschaft), editor (1997) Verhaltenstoxikologie und MAK-Grenzwertfestlegungen. Wissenschaftliche Arbeitspapiere. Weinheim: Wiley-VCH.

Cross-sectional studies with only single determinations of exposure levels and only single examinations of the exposed persons do not generally permit the association of any observed symptoms with the current exposure situation. This requires information as to past exposure levels.

Therefore, longitudinal studies with repeated determination of the workplace and systemic exposure levels and repeated examination of the exposed persons play a decisive role in the establishment of limit values. Valid epidemiological studies of persons exposed for long periods to concentrations which do not produce adverse effects provide a reliable basis for the establishment of limit values for the workplace, especially when the study design permits statements as to both local and systemic effects.

The diverse sensitivities of individual employees (as determined by age, constitution, nutrition, climate, etc.) are taken into consideration in the establishment of MAK values. It is currently not possible to take sex-specific differences in toxicokinetics and toxicodynamics into account when establishing MAK and BAT values because of the lack of appropriate scientific data.

When the NOAEL has been determined from the effects of the substance in man observed at the workplace, the MAK value is generally established at the level of this NOAEL.

When deriving MAK values for systemic effects and effects on the lungs from studies with volunteers at rest, the results are extrapolated to the increased respiratory minute volume at the workplace. The MAK value is established at half of the concentration used in the volunteer study, which is calculated from the ratio of the respiratory volume of workers to that of persons at rest. Gases and vapours with a blood:air partition coefficient of < 5 represent an exception (see the documentation "Increased respiratory volume at the workplace – Significance for the derivation of the MAK value" (b). In addition, the results are extrapolated to the longer daily exposure at the workplace, unless there are toxicokinetic data available that show this to be unnecessary.

#### c) Values based on effects on animals

Because the effects in man are not known for many substances, MAK values are often derived from results obtained with experimental animals. This is carried out in the clear understanding of the problems associated with extrapolation between species and of the much smaller group sizes than is usual in epidemiological studies. On the other hand, animal studies carried out according to modern principles also offer advantages including precise characterization of exposure levels, the wide range of parameters that can be studied, and the possibility of determining dose-response relationships and NOAELs. The minimum database for the derivation of a MAK value is generally considered to be a NOAEL from a valid 90-day inhalation study with experimental animals. Of the results of studies in which substances were administered to experimental animals by the oral or dermal route, mostly only the systemic effects may be considered to be relevant for persons exposed at the workplace. Therefore, in the documentation of a MAK value such results must be accompanied by information about the local effects of the substance, especially the effects on the respiratory tract.

To extrapolate an oral dose from an animal study to a concentration in the air at the workplace, the Commission uses a procedure which in essence corresponds with that described in the document for determination of "Derived No-Effect Levels" (Guidance on Information Requirements and Chemical Safety Assessment, Chapter R.8, ECHA 2008). The only difference is that the Commission assumes 100 % absorption after inhalation and oral administration when there are no substance-specific data. Exceptions to this are the metals and metal compounds, for which 50 % absorption is assumed after oral administration if substance-specific data are not available.

Procedure: If substance-specific data are not available, the oral dose is divided by the following correction factor (ECHA 2008), depending on the species:

```
mouse: 7; rat: 4; rabbit: 2.4; monkey: 2; dog: 1.4.
```

The further assumptions (human body weight: 70 kg, breathing volume: 10 m³ per 8 hours) still apply. The conversion is calculated with the following formula:

Inhaled concentration =

 $\frac{\text{oral dose (mg/kg body weight and day) x oral absorption in the animal (%) x 70 kg body weight}{\text{species-specific correction factor x inhalation absorption in humans (%) x (10 m³ per day)}$ 

<sup>16)</sup> Hartwig A, MAK Commission (2017) Increased respiratory volume at the workplace – Significance for the derivation of the MAK value. MAK Value Documentation, 2017. MAK Collect Occup Health Saf 2(2): 277–283. <a href="https://doi.org/10.1002/3527600418.mbrespivole6217">https://doi.org/10.1002/3527600418.mbrespivole6217</a>

For example, a dose of 1 mg/kg body weight in the rat, a substance-specific oral absorption of 80 % and unknown inhalation absorption result in the following concentration:

$$\frac{1 \text{ mg/kg x 80\% x 70 kg}}{4 \text{ x 100\% x 10 m}^3} = 1.4 \text{ mg/m}^3$$

Assuming that the same external concentration in the air leads to the same internal exposure in all species at rest, it must be taken into account when extrapolating data from inhalation studies in animals to humans that in the case of systemic effects and effects in the lungs the body burden (related to kg body weight) of the worker at the workplace, with an assumed respiratory volume of 10 m<sup>3</sup> in 8 hours, is about twice as high as that of the experimental animal in the usual 6-hour experiment. The equivalent external concentration at the workplace is, therefore, half of that used in the experiment. This applies only for gases and vapours with a blood:air distribution coefficient of >5 and for aerosols, provided that the effect is the product of cxt. If it can be shown that the critical effect depends more on the concentration than the product of c×t and that the steady state was reached within the duration of the experiment, the equivalent concentration at the workplace is two thirds of the concentration used in the experiment (1:1.5), as then extrapolation of the usual 6-hour exposure in animal experiments to the 8-hour exposure at the workplace is no longer necessary (see the documentation "Increased respiratory volume at the workplace - Significance for the derivation of the MAK value"17)). If there are valid PBPK models of exposure with the relevant metabolites in humans and animals these are used for extrapolation from the experimental animal to persons at the workplace. If necessary, the dose in the animal experiment is converted if the frequency of exposure differed from that at the workplace. With continuous exposure (for example, feeding studies) the NOAEL from the animal experiment is therefore multiplied by 7/5 to take into consideration the continuous exposure of the animals compared with the intermittent exposure of the usual 5-day working week. With administration of the substance with the diet or drinking water to rats and mice, as a rule the factors used by the EFSA<sup>18</sup>) are used to convert the values into a dose per kg body weight, if there are no measured values.

When the NOAEL is based on results with animals in oral or inhalation studies, the MAK value is generally established at the level of half of the concentration in air extrapolated for workers at the workplace. However, in some cases species differences in sensitivity to the substance must be taken into account and here the toxicokinetic data are particularly important.

### d) Exceptional workplaces

The concentrations of inhaled gaseous substances in blood and tissues of persons working under hyperbaric pressure have been shown to correlate positively with the pressure. This dependence of the body burden on the workplace conditions must be taken into account in the application of MAK and BAT values.

#### e) Chemosensory perceptions and effects

Substances present in the workplace air as gas or aerosol are potentially able to induce chemosensory perceptions and thus associated effects relevant to health.

Humans possess very sensitive chemosensory senses which are able to perceive chemicals at the workplace. The sense of smell (nervus olfactorius) is particularly sensitive and perceives both *pleasant* and *unpleasant* odours even at very low concentrations, frequently below the MAK value. The so-called "trigeminal chemoreception" (nervus trigeminus) perceives *burning* and *biting* sensations, above all at higher concentrations of the substance in the workplace air. Both senses serve primarily the perception of volatile chemicals in the ambient air but can also warn the organism against possible dangers. The sense of smell possesses above all a "psychological" warning function, while trigeminal chemoreception can induce defence mechanisms to avoid damage to tissues.

Nevertheless, the mere perception of the chemical is not a health effect; in addition (a) sensory irritation, (b) considerable odour annoyance or (c) in individual cases "odour-associated" symptoms must occur.

#### Sensory irritation

Trigeminal nerve fibres occur in almost all regions of the nose, but also in the mucous membranes of the eyes, the oral cavity and the throat. Various receptors are found on these fibres of the peripheral nervous system, which can be activated by chemicals. They detect changes in temperature and other changes in the milieu (for example, changes in pH) in their immediate environment. The activation of these chemoreceptors forms the physiological

<sup>17)</sup> Hartwig A, MAK Commission (2017) Increased respiratory volume at the workplace – Significance for the derivation of the MAK value. MAK Value Documentation, 2017. MAK Collect Occup Health Saf 2(2): 277–283. <a href="https://doi.org/10.1002/3527600418.mbrespivole6217">https://doi.org/10.1002/3527600418.mbrespivole6217</a>

<sup>18)</sup> EFSA (European Food Safety Authority) (2012) Guidance on selected default values to be used by the EFSA Scientific Committee, scientific panels and units in the absence of actual measured data. EFSA J 10: 2579. https://doi.org/10.2903/j.efsa.2012.2579

basis of sensory irritation. Sensory irritation is understood to be an acute, more or less concentration-dependent effect, which can be regarded as reversible until the activation of the receptors leads to defence reflexes (for example, an increase in blinking frequency, or the release of neurogenic inflammation markers). This sensory defence reaction takes place without signs of inflammation or histopathological changes yet being evident. The sensory NOAEC can be determined in human studies (subjective/objective symptoms) or estimated from suitable studies with animals (mouse, RD10). At higher concentrations, however, neurogenic inflammation and adverse histopathological changes of the upper respiratory tract (for example, an inflammatory reaction of the tissue, atrophy/degeneration of the olfactory epithelium) may additionally occur. Such effects have been observed in inhalation studies with rodents. A NOAEC can be derived for this, which can decrease with increasing exposure duration. According to an empirical study<sup>19</sup>), if there are no studies in humans for sensory irritation, the long-term NOAEC for histopathological effects of the upper respiratory tract of rodents can be used to estimate a NAEC for sensory irritation (eyes, nose) in humans. If the target tissue is the olfactory epithelium in rodents, no sensory irritation is to be expected at half the value of the long-term NOAEC; for other target tissues of the upper respiratory tract the same is true at a third of the value of the corresponding NOAEC. If there is only a short or medium-term study available, its NOAEC is divided by 6 or 2, respectively, to extrapolate a long-term NAEC<sup>19</sup>), unless the data for the substance or a better-investigated analogous substance suggest that the increasing exposure duration does not lead to an increase in the effects or leads to an increase of different magnitude. If no NOAEC was obtained, with a suitable database the lower confidence interval of a benchmark dose (BMDL<sub>05</sub> or BMDL<sub>SD</sub>) can be calculated or the NAEC can be estimated by dividing the LOAEC by 2 or 3 depending on the severity of the effects and the gradient of the concentration-effect relationship.

#### Considerable odour annoyance

The receptors of the sense of smell (nervus olfactorius) are activated even at low concentrations of a chemical and induce action potentials in the olfactory nerve. Initally, this leads to the perception of an odour (perception threshold). The basis for this perception is the characteristic activation pattern of the around 350 different odour receptors in humans, which, however, can change very rapidly depending on the duration and concentration of the exposure. These dynamic processes ultimately lead to the recognition of an odour. For the brain to recognise a particular odour (identification threshold), in some cases the concentrations need to be 10 times as high as those necessary for the perception threshold. The primary criterion by which humans judge unknown odours is their hedonic quality; whether they are *pleasant* or *unpleasant*. These judgements are very subjective and individual as they are learnt during the course of life and are connected with the person's experiences with certain odours.

Chemicals at the workplace often have an *unpleasant* smell. Persistent intensive or nauseous odours may lead to *excessive annoyance*. As a rule, this not only involves the perception of the odour, but also *trigeminal* sensations (biting, burning) and the otherwise very pronounced adaptation/habituation to chemosensory irritation does not take place. From an objective physiological point of view, it is almost impossible to say when *excessive annoyance* has been reached. Indirect indicators are reduced cognitive performance resulting from the diversion caused by the substance when the annoying chemosensory perception can no longer be ignored and hinders the actual task being performed. In controlled studies in humans, such behavioural effects can be determined using standardized neuropsychological test procedures.

# "Odour-associated" symptoms

Certain chemical substances can induce immediate "odour-associated" symptoms such as nausea or headaches in some people. As a rule, nothing is known in the scientific literature about the physiological mechanisms behind these symptoms, but it is above all very odour-intensive substances that cause such reactions in certain individuals. Substances which can cause "odour-associated" symptoms even at concentrations below the MAK value are given the footnote "Even if the MAK value is observed, "odour-associated" symptoms cannot be ruled out in individual cases.". A substance is designated with this footnote according to the following criteria: (a) a low, psycho-physically determined odour threshold, (b) a very unpleasant odour even in the range of the perception threshold or (c) case reports or observations which describe the increased occurrence of "odour-associated" symptoms<sup>20</sup>).

<sup>&</sup>lt;sup>19</sup>) Brüning T, Bartsch R, Bolt HM, Desel H, Drexler H, Gundert-Remy U, Hartwig A, Jäckh R, Leibold E, Pallapies D, Rettenmeier AW, Schlüter G, Stropp G, Sucker K, Triebig G, Westphal G, van Thriel C (2014) Sensory irritation as a basis for setting occupational exposure limits. #### Habituation

When only the odour is perceived, constant exposure to certain substances (for example, hydrogen sulfide, 2-methyl-2-propanethiol) can lead to habituation and thus also to impairment or the complete loss of the olfactory perception of this substance. Also for this reason, odour perception is not a suitable "warning" against hazardous exposure to such chemicals. At present there is not enough substance-specific knowledge about the underlying mechanisms of very pronounced habituation processes (for example, changes to the odour receptors) and the concentration–effect relationships involved. In the case of such substances, attention must be drawn to this phenomenon of olfactory perception.

#### **Documentation**

A detailed scientific documentation of each decision is published in "The MAK Collection for Occupational Health and Safety"<sup>21</sup>). These documents present, clearly and in detail, the scientific data and the reasons for the establishment of a MAK value. Because of this system, it is sufficient to establish only general principles for the derivation of MAK values. The assessment of individual substances on the basis of all the available toxicological and occupational medical data yields a more differentiated and specific evaluation than would the observance of stringently formulated rules.

The published data for the toxicity and effects of a substance in man and animals and all other relevant information are organized according to the kind of effect and presented in the form of a review. This review of the toxicological and epidemiological data for a substance serves initially as a basis for the discussion within the Commission for the derivation of a MAK value and for detailed evaluation of the physicochemical properties, percutaneous absorption, sensitizing effects, carcinogenic effects, prenatal toxicity and germ cell mutagenicity of the substance. When new data become available, the MAK value, classification and designation of the substance are reassessed and, when necessary, altered.

#### **Publication**

Prospective changes and new entries are announced one year in advance in the List of MAK and BAT Values, usually on 1st July. In addition, the new entries are published on the homepage of the Commission at the DFG (www.dfg.de/mak-ankuendigung). If necessary, in addition to the regular updates each year in July, further announcements of prospective changes and new entries can be made there at any time. Following ratification of the annual List, the organizations listed below are officially informed of the planned changes: "Länderausschuss für Arbeitsschutz und Sicherheitstechnik (LASI)" (Federal Committee for Occupational Safety and Technical Security), the "Bundesverband der deutschen Industrie" (Federation of German Industries), the "Deutsche Gesetzliche Unfallversicherung" (German Statutory Accident Insurance) and the "Deutsche Gewerkschaftsbund" (the German Trade Union Federation). The purpose of this measure is to give these organizations enough time to send to the Commission any available scientific documentation relevant to the planned changes and additions to the List of MAK and BAT Values.

# Mixtures of substances

In general, the MAK value is only valid for exposure to a single, pure substance. It cannot be applied unconditionally to one component of a mixture in the workplace air or to a technical product which might contain more toxic impurities. Simultaneous or successive exposure to several substances may be much more or, in isolated cases, even less dangerous than the exposure to one of the substances on its own. A MAK value for a mixture of substances cannot be satisfactorily determined by simple calculation because the components of the mixture generally have very different kinds of effect; MAK values can presently be established for such mixtures only after specific toxicological examination or studies of the particular mixture of substances. Given the inadequacy of the currently available data, the Commission decidedly refrains from calculating MAK values for mixtures, particularly for liquid solvent mixtures. However, it is willing, on the basis of appropriate investigations, to provide values for defined vapour mixtures of practical relevance.

#### **Analytical controls**

The compliance with MAK and BAT values (that is, keeping the exposure levels below these values) is intended to protect the health of persons exposed to hazardous substances at work. This objective can be ensured only by regular analytical determination of the concentration of the hazardous substances in the workplace air or of the

<sup>&</sup>lt;sup>21</sup>) available online under <a href="https://mak-dfg.publisso.de">https://mak-dfg.publisso.de</a>

concentration of the substances, their metabolites or other parameters of intermediary metabolism in the body fluids of exposed persons. For this purpose, it is necessary to use analytical methods which have been tested regarding the analytical reliability and practicability.

The Commission's analytical working groups for air analyses and for analyses in biological materials have developed such methods and published them<sup>22</sup>). These collections of methods are supplemented regularly and are published in both German and English. The methods are conceived as so-called standard operating procedures (SOP) which are intended to ensure comparability of the analytical results from laboratory to laboratory and with the corresponding limit values. Thus they contribute to the quality control of the results. In addition, they provide a good basis for the health protection which is the objective of the limit values.

In the development of these analytical methods, the accuracy and reliability of the results is the most important factor. The methods are updated regularly if new scientific and instrumental findings indicate changes. In this respect the methods always reflect the current state of technology and are well-suited for monitoring limit values.

The methods for analyses in biological materials are, whenever possible, designed so that their measurement range includes the background concentration range. In this way it is possible to differentiate between occupational and environmental exposure and to correctly evaluate the analytical results.

# Substances that can occur simultaneously as vapour and aerosol

Substances in the air at the workplace usually occur either as gas/vapour or as an aerosol in the form of either drop-lets (mist) or as dust. There are, however, also substances that do not follow this categorisation. These are substances with a low vapour pressure at room temperature, which can therefore occur in relevant amounts as both vapour and aerosol. They can be both liquids and sublimating solids.

When determining the inhalation exposure to substances it must always be considered whether vapour and aerosol mixtures can be formed as a result of the work process. This must be taken into account during the determination and evaluation. In particular, such mixtures occur above all when aerosols are formed during the work process, for example as a result of mechanical processes such as the processing of metals or ceramics, during dipping processes in electroplating or during spraying processes. In addition, there are manufacturing processes in which non-volatile substances evaporate at higher temperatures and then condense again, for example, during the hot processing of bitumen or laser welding, and thus occur in the workplace air simultaneously as a vapour and an aerosol. According to DIN EN 23861<sup>23</sup>), for substances with a vapour pressure at room temperature of less than 100 Pa and more than 0.001 Pa sampling procedures should always be selected which determine vapour and aerosols simultaneously in one sampling system. Liquids with boiling points between around 200 °C and 320 °C usually fall into this category. The mass transfer between the vapour and condensed phase is a dynamic process which is continually changing as a result of influences such as temperature or air currents. The exact distribution of a substance in the workplace air between the vapour phase and condensed phase is very difficult to determine, and therefore not possible in practice. Systems with which aerosols and vapour can be determined together (the aerosol is determined as the inhalable fraction) are suitable for sampling such substances.

For substances with the physical properties described and for which there is a MAK value for the respirable fraction of the particle phase, at workplaces it is not possible, for analytical reasons, to determine only the respirable aerosol fraction. For these substances it is also recommended that the inhalable fraction is determined to cover the "worst-case" scenario<sup>24</sup>). As a result of the dynamic behaviour of these substances, only the sum of the vapour and particle fractions can be determined reliably as long as the particle fraction is determined in its entirety as the inhalable fraction.

Substances in the list in Section II which can occur simultaneously as a vapour and an aerosol are marked with the following note: "The substance can occur simultaneously as vapour and aerosol".

<sup>&</sup>lt;sup>22</sup>) Available online under <a href="https://mak-dfg.publisso.de">https://mak-dfg.publisso.de</a>.

The Commission welcomes suggestions for inclusion of new substances as well as analytical methods. Analytical methods for carcinogenic workplace substances are published in cooperation with the analytical chemistry group from the German statutory accident insurance, 'Arbeitsgruppe Analytik im Sachgebiet "Gefahrstoffe" des Fachbereichs "Rohstoffe und chemische Industrie" der Deutschen Gesetzlichen Unfallversicherung' ("Von den Unfallversicherungsträgern anerkannte Analysenverfahren zur Feststellung der Konzentrationen krebserzeugender, erbgutverändernder oder fortpflanzungsgefährdender Stoffe in der Luft in Arbeitsbereichen" (DGUV Informationen 213–5xx)), DGUV, D81359 München: <a href="https://www.bgrci.de/fachwissen-portal/themenspektrum/gefahrstoffe/gefahrstoffanalytik/inhalte/dguv-informationen-213-5xx/">https://www.bgrci.de/fachwissen-portal/themenspektrum/gefahrstoffe/gefahrstoffanalytik/inhalte/dguv-informationen-213-5xx/</a>

# II. List of Substances

In the following list, maximum concentrations in the workplace air (MAK values) of gases, vapours and aerosols are expressed in ml/m3 (millilitre (ml) of the substance per cubic metre (m³) of air, ppm), a unit which is unaffected by temperature and barometric pressure, as well as in mg/m³ (milligram (mg) of the substance per cubic metre (m³) of air) $^{25}$ ), a unit which is temperature and pressure dependent and has therefore been adjusted to a temperature of 20 °C and barometric pressure of 1013 hPa $^{26}$ ); the MAK values for **non-volatile aerosols** (dust, smoke, mist) are given in mg/m³ air. Non-volatile aerosols are substances which have such a low vapour pressure that at normal temperatures a dangerously high concentration cannot occur in the gaseous phase.

Since the health hazards associated with handling a substance can be affected by its **volatility**, the **vapour pressure** of a series of highly volatile compounds has been listed for 20 °C, unless otherwise stated. Knowledge of the vapour pressure makes it possible to estimate whether hazardous concentrations of the substance can accumulate by evaporation under the conditions prevailing at the particular workplace. The listed vapour pressure values are taken from the literature, mainly from the US National Library of Medicine, the ECHA, the SRCPhysprop or the GESTIS database, and have been rounded for practical purposes.

*	MAK [ml/m <sup>3</sup> ]	MAK value in ml/m³ (ppm)	value or "–"	see Section I
	MAK [mg/m³]	MAK value in mg/m³ measured as the respirable fraction the inhalable fraction	value or "–" R I	see Section I see Section Vd see Section Vd
	Peak lim	peak limitation category (excursion factor)	I/II or "–" (1 to max. 8)	see Section VI
	Preg gr	pregnancy risk group	A, B, B (suspected), C, D or "-"	see Section VIII
	Perc abs	danger from percutaneous absorption	designated with H or "–"	see Section VII
	Sens	danger of sensitization	designated with	
		– of the airways	Sa or "–"	see Section IV
		– of the skin	Sh or "–"	see Section IV
		– of the airways and the skin	Sah or "–"	see Section IV
		danger of photocontact sensitization	SP or "-"	see Section IV
	Carc cat	carcinogen category	1, 2, 3, 4, 5 or "-"	see Section III
	Muta cat	germ cell mutagen category	1, 2, 3 A, 3 B, 5 or "-"	see Section IX

A dash "–" is used for the MAK value, the peak limitation category and the pregnancy risk group to indicate that the substance has been evaluated, but a MAK value could not be derived and that neither a peak limitation category, nor a pregnancy risk group has therefore been established. A dash "–" has been used for the pregnancy risk group since 2024 to indicate that the data that are available do not provide evidence of a potential hazard or prenatal toxicity (Pregnancy Risk Group B (suspected)).

A dash "-" is used for the designation of percutaneous absorption and sensitization, and for the carcinogen category and germ cell mutagen category to indicate that the substance has been evaluated, but has not been assigned to a category or given a designation.

★ indicates a change from the 2024 List of MAK and BAT Values.

<sup>&</sup>lt;sup>25</sup>) "mg/m3" is a measure which means milligram (mg) of the substance per cubic metre (m<sup>3</sup>) of air

Under the specified atmospheric conditions (20 °C, 1013 hPa) the concentration values can be converted according to the following formula:  $C(mg/m^3) = \frac{molar\ mass\ in\ g}{molar\ volume\ in\ l} \cdot C(ml/m^3)$ 

The molar volume corresponds to 24.1 l at 20  $^{\circ}$ C and 1013 hPa (mbar).

The MAK value is generally established with the units ml/m³; the value in mg/m³ is then calculated with the formula given above. Following a suggestion from users, the calculated values are given correct to two significant figures.

# a) Substances with MAK values and substances listed in Sections IIb, IIc and III to XII

MAK values which were established on the condition that the working week exceeds 40 hours have been retained with no change in the toxicological evaluation.

Perc abs: Sens: Carc cat: Muta cat: -

## N-Chloroformylmorpholine

[15159-40-7]

The substance can occur simultaneously as vapour and aerosol. VP[hPa]:  $0.4\,$ 

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: Carc cat: 2

2-Chloro-N-hydroxymethylacetamide  $\rightarrow$  N-Methylolchloroacetamide

N-(((3R)-5-Chloro-8-hydroxy-3-methyl-1-oxo-7-isochromanyl)carbonyl)-3-phenyl-L-alanine  $\rightarrow$  Ochratoxin A

## Chloromethane

[74-87-3]

CH<sub>3</sub>Cl

VP[hPa]: 5733 at 25℃

 $\begin{array}{llll} MAK[ml/m^3]: & 10 \\ MAK[mg/m^3]: & 21 \\ Peak lim: & II(1) \\ Preg gr: & D \\ Perc abs: & - \\ Sens: & - \\ Carc cat: & - \\ Muta cat: & - \end{array}$ 

## 4-Chloromethyl-biphenyl

[1667-11-4]

The substance can occur simultaneously as vapour and aerosol. see Section IIb  $\,$ 

 $\begin{array}{lll} MAK[ml/m^3]: & - \\ MAK[mg/m^3]: & - \\ Peak lim: & - \\ Preg gr: & - \\ Carc cat: & - \\ \end{array}$ 

## 5-Chloro-2-methyl-2,3-dihydroisothiazol-3-one and 2-methyl-2,3-dihydroisothiazol-3-one

[26172-55-4; 2682-20-4] mixture in ratio 3:1

$$CI \longrightarrow S$$
 $CH_3$ 
 $S$ 
 $O$ 
 $O$ 

see Section Xc

 $\begin{array}{ll} MAK[mg/m^3]\colon & 0.2\ I\\ Peak\ lim\colon & I(2)\\ Preg\ gr\colon & C \end{array}$ 

Classification in Pregnancy Risk Group C was re-evaluated in 2011 and confirmed.

Perc abs: Sens: Sh

Carc cat: Muta cat: -

## 3-Chloro-2-methylpropene

[563-47-3]

VP[hPa]: 140

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: Carc cat: 3

1-Chloro-2-nitrobenzene  $\rightarrow$  o-Chloronitrobenzene

1-Chloro-4-nitrobenzene  $\rightarrow$  p-Chloronitrobenzene

#### o-Chloronitrobenzene

[88-73-3]

The substance can occur simultaneously as vapour and aerosol. VP[hPa]:  $0.43\,$ 

 $\begin{array}{lll} MAK[ml/m^3]: & - \\ MAK[mg/m^3]: & - \\ Peak lim: & - \\ Preg gr: & - \\ Perc abs: & H \\ Carc cat: & 3 \end{array}$ 

#### m-Chloronitrobenzene

[121-73-3]

The substance can occur simultaneously as vapour and aerosol.

VP[hPa]: 0.129 at 25℃ see Section IIb

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: Perc abs: H
Sens: Carc cat: -

#### p-Chloronitrobenzene

Muta cat:

[100-00-5]

$$O_2N$$
—Cl

The substance can occur simultaneously as vapour and aerosol. VP[hPa]: 0.085

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: Perc abs: H
Carc cat: 3

#### 1-Chloro-1-nitropropane

[600-25-9]

H<sub>3</sub>C-CH<sub>2</sub>-CHClNO<sub>2</sub>

see Section IIb

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: -

## 4-Chlorophenyl isocyanate

[104-12-1]

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: Perc abs: Sens: Carc cat: 3
Muta cat: -

Chlorophora excelsa  $\rightarrow$  Woods

#### Chloropicrin $\rightarrow$ Trichloronitromethane

#### Chloroprene

[126-99-8]

## H<sub>2</sub>C=CCl-CH=CH<sub>2</sub>

VP[hPa]: 267 see Section XII

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: Perc abs: H
Sens: Carc cat: 2
Muta cat: -

## 3-Chloro-1,2-propanediol (α-chlorohydrin)

[96-24-2]

## HOCH2-CHOH-CH2Cl

The substance can occur simultaneously as vapour and aerosol. VP[hPa]:  $0.27\,$ 

 $\begin{array}{llll} MAK[ml/m^3]: & 0.005 \\ MAK[mg/m^3]: & 0.023 \\ Peak lim: & II(8) \\ Preg gr: & D \\ Perc abs: & H \\ Sens: & - \\ Carc cat: & 3 \end{array}$

- 2-Chloro-2-propene nitrile  $\rightarrow$  2-Chloroacrylonitrile

1-[(E)-3-chloroprop-2-enyl]-3,5,7-triaza-1-azoniatricyclo[3.3.1.1 $^{3.7}$ ]decane;chloride  $\rightarrow$  Methenamine 3-chloroallylchloride

## Chlorothal on il

[1897-45-6]

VP[hPa]: <0.013 at 40°C see Section IIb and Xc

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: Perc abs: Sens: Sh
Carc cat: Muta cat: -

#### 4-Chloro-o-toluidine

[95-69-2]

The substance can occur simultaneously as vapour and aerosol. VP[hPa]: 0.055 at  $25^{\circ}$ C (calculated value)

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: Perc abs: H
Carc cat: 1
Muta cat: 3A

#### 5-Chloro-o-toluidine

[95-79-4]

The substance can occur simultaneously as vapour and aerosol. VP[hPa]:  $0.45\,$ 

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: Carc cat: 3

- 1-Chloro-4-(trichloromethyl) benzene  $\rightarrow$  p-Chlorobenzotrichloride
- 1-Chloro-2,2,2-trifluoroethyl difluoromethyl ether  $\rightarrow$  Isoflurane
- 2-Chloro-1,1,2-trifluoroethyl difluoromethyl ether  $\rightarrow$  Enflurane

#### Chlorotrifluoromethane (FC-13)

[75-72-9]

CClF<sub>3</sub>

 $\begin{array}{lll} MAK[ml/m^3]: & 1000 \\ MAK[mg/m^3]: & 4300 \\ Peak lim: & II(8) \\ Preg gr: & D \end{array}$ 

## Chlorpromazine (2-chloro-10-(3-dimethylaminopropyl)phenothiazine)

[50-53-3]

see Section IV

Sens: SP

Chrome yellow  $\rightarrow$  Lead chromate

## Chromium carbonyl

[13007-92-6]

 $Cr(CO)_6$ 

see Section IIb

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: Sens: Carc cat: Muta cat: -

#### Chromium(III) compounds

see Section IIb and XII

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: Perc abs: Sens: Sh

does not apply for chromium(III) oxide and similar poorly

 $soluble\ chromium (III)\ compounds$ 

Carc cat: Muta cat: -

## Chromium(VI) compounds

(inhalable fraction)

see Section XII

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: Perc abs: H

the chromates of barium, lead, strontium and zinc are not

designated with "H" Sens: Sh

barium chromate and lead chromate are not designated with

"Sh"

Carc cat: 1 Muta cat: 2

#### Chrysene

[218-01-9]

see Section III, "pyrolysis products of organic materials"

MAK[ml/m³]: MAK[mg/m³]: Peak lim: Preg gr: Perc abs: H
Sens: Carc cat: 2
Muta cat: -

Chrysotile (fibrous dust)  $\rightarrow$  Asbestos (fibrous dust)

Chymotrypsin → Trypsin and Chymotrypsin

#### Cinnamaldehyde

[104-55-2]

The substance can occur simultaneously as vapour and aerosol.

VP[hPa]: 0.029 see Section IV

Sens: Sh

Cinnamic alcohol → Cinnamyl alcohol

Cinnamic aldehyde  $\rightarrow$  Cinnamaldehyde

### Cinnamyl alcohol

[104-54-1]

The substance can occur simultaneously as vapour and aerosol. VP[hPa]:  $0.012\,$  at  $25^{\circ}$ C

see Section IV

Sens: Sh

C.I. Pigment Red 104  $\rightarrow$  Lead chromate

C.I. Pigment Yellow  $34 \rightarrow \text{Lead chromate}$ 

 $Citrates \to Citric\ acid$

#### Diesel engine emissions

Because of the new diesel engine technology the emissions have changed significantly in quality and quantity. Since it must be assumed that these new diesel engines were introduced at the end of the 1990s, all the available epidemiological studies which were evaluated in 2007 are based on exposures to emissions from older diesel engines. The emissions from the new diesel engines can not be evaluated until appropriate studies become available. see Section III, "pyrolysis products of organic materials"

# b) Substances for which no MAK value can be established at present

For a number of the substances examined by the Commission, studies of the effects in man or in experimental animals have yielded insufficient information for the establishment of MAK values. These substances are listed below. The toxicological documentation has been published by the Commission in "The MAK Collection for Occupational Health and Safety". Some of these reviews are available in English (available online under https://mak-dfg.publisso.de).

```
Acetoacetic acid ethyl ester [141-97-9]
Acrylic acid hydroxypropyl ester (all isomers) [25584-83-2]
Allyl propyl disulfide [2179-59-1]
3-Aminomethyl-3,5,5-trimethyl-cyclohexylamine (isophorone diamine) [2855-13-2]
2-Aminopyridine [504-29-0]
Ammonium sulfamate [7773-06-0]
Arsine [7784-42-1]

Camphor [76-22-2]
```

Chlorinated biphenyl oxides several CAS Nos, e.g. [55720-99-5]

Chlorinated biphenyl oxides form a group of compounds with different degrees and positions of chlorine substitution. Chlorinated biphenyl oxides with low chlorine content can occur as a particle-vapour mixture, whereas chlorinated biphenyl oxides with a large quantity of chlorine occur only as particles.

#### Chlorinated naphthalenes

Chlorinated naphthalenes form a group of compounds with different degrees and positions of chlorine substitution. Chlorinated naphthalenes with low chlorine content can occur as a particle-vapour mixture, whereas chlorinated naphthalenes with a large quantity of chlorine occur only as particles.

Methyl vinyl ketone [78-94-4]

Molybdenum [7439-98-7] and its compounds apart from molybdenum trioxide

Montmorillonite [1318-93-0] and Bentonite [1302-78-9]

quartz content must be considered separately

2-(4-Morpholinylmercapto)benzothiazole [102-77-2]

Nickel titanic yellow pigment [8007-18-9]

Nicotine [54-11-5]

Nitric acid [7697-37-2]

Osmium tetroxide [20816-12-0]

Palladium [7440-05-3] and palladium compounds

Pentaborane [19624-22-7]

2-Pentanone [107-87-9]

Perchloromethyl mercaptan [594-42-3]

1H,1H,2H-Perfluorohexene [19430-93-4]

Phosphorus, red [7723-14-0]

Phosphorus pentasulfide [1314-80-3]

o-Phthalic acid [88-99-3]

Phthalic anhydride [85-44-9]

Platinum compounds (chloroplatinates)

A peak concentration of  $2 \mu g/m^3$  should not be exceeded.

n-Propyl nitrate [627-13-4]

Pyrethrum [8003-34-7]

Resorcinol [108-46-3]

Rotenone [83-79-4]

Silicon carbide (without fibres) [409-21-2]

Sodium hydroxide [1310-73-2]

Stibine [7803-52-3]

Strontium [7440-24-6] and its inorganic compounds

Strychnine [57-24-9]

Sulfur monochloride [10025-67-9]

Sulfur pentafluoride [5714-22-7]

Tellurium [13494-80-9] and its inorganic compounds

1,1,2,2-Tetrabromoethane [79-27-6]

Tetramethyl succinonitrile [3333-52-6]

Tetramethyl urea (TMU) [632-22-4]

Thallium, soluble compounds

Thioglycolic acid [68-11-1]

Tin [7440-31-5] and its inorganic compounds

2,4,6-Tribromophenol [118-79-6]

Tri-n-butylamine [102-82-9]

Reaction with nitrosating agents can result in the formation of carcinogenic N-nitrosodi-n-butylamine, see Section III "Amines which form carcinogenic nitrosamines on nitrosation".

2,4,5-Trichlorophenol [95-95-4]

Triisobutyl phosphate [126-71-6]

Trimethylphosphite [121-45-9]

Tungsten [7440-33-7] and its compounds (as W)

Wollastonite (fibrous dust) [13983-17-0]

Yttrium [7440-65-5] and its compounds

Zeolites, synthetic (non-fibrous) [1318-02-1]

Zinc pyrithione [13463-41-7]

Zirconium [7440-67-7] and its compounds (except zirconium dioxide)

#### Metal-working fluids, hydraulic fluids and other lubricants

(see Section Xc)

Abietic acid [514-10-3]

also includes disproportionation and transposition products

Alkyl amines, C11–14-branched, monohexyl and dihexyl phosphates  $\left[80939\text{-}62\text{-}4\right]$ 

Alkyl benzenesulfonates C10-C14, linear [69669-44-9; 85117-50-6]

Alkyl ether carboxylic acids

2-Amino-2-ethyl-1,3-propanediol [115-70-8]

1-Amino-2-propanol [78-96-6]

Aminotris(methylenephosphonic acid) [6419-19-8] and its sodium salts

Azelaic acid [123-99-9]

Behenic acid [112-85-6]

1,2-Benzisothiazol-3(2H)-one [2634-33-5]

Bis[O,O-bis(2-ethylhexyl) dithiophosphorato-S,S']dioxodi-μ-thioxodimolybdenum [68958-92-9; 72030-25-2]

Bithionol [97-18-7]

2-Bromo-2-nitro-1,3-propanediol [52-51-7]

use forbidden as component of metal-working fluids and corrosion inhibitors: see "GefStoffV 2010, Anhang II (zu §16 Absatz 2), Nr. 4"

```
2-Butyl-1,2-benzisothiazolin-3-one [4299-07-4]
Calcium bis(dinonylnaphthalenesulphonate) [57855-77-3]
5(or 6)-Carboxy-4-hexylcyclohex-2-ene-1-octanoic acid [53980-88-4]
2-Chloroacetamide [79-07-2]
p-Chloro-m-cresol [59-50-7]
Chlorothalonil [1897-45-6]
Citric acid alkali metal salts
The MAK value for citric acid (2 mg/m³) protects from irritation, a higher value for alkali metal salts is not justifiable.
Dibenzyl disulfide [150-60-7]
2,2-Dibromo-2-cyanacetamide [10222-01-2]
1,2-Dibromo-2,4-dicyanobutane [35691-65-7]
3-(3,5-Di-tert-butyl-4-hydroxyphenyl)-N'-[3-(3,5-di-tert-butyl-4-hydroxyphenyl)propanoyl]propanehydrazide
   [32687-78-8]
2,6-Di-tert-butylphenol [128-39-2]
Di-n-butyl phosphonate [1809-19-4] see also Di-n-octyl phosphonate
Diethylenetriaminepenta(methylenephosphonic acid) [15827-60-8] and its sodium salts [22042-96-2]
1,2-Dihydro-2,2,4-trimethyl-quinoline polymer [26780-96-1]
4-(Diiodomethylsulfonyl)-toluene [20018-09-1]
4,4'-Dioctyldiphenylamine [101-67-7]
Di-n-octyl phosphonate [1809-14-9] see also Di-n-butyl phosphonate
Diphenylamine, octylated (benzenamine, N-phenyl-, reaction products with 2,4,4-trimethylpentene) [68411-46-1]
Diphenylamine, reaction products with styrene and 2,4,4-trimethylpentene [68921-45-9]
2,2'-Dithiobis(N-methylbenzamide) [2527-58-4]
Dodecanedioic acid [693-23-2]
1-Dodecanol [112-53-8]
2-Ethyl-1,3-hexanediol [94-96-2]
Fatty acids, C14-18 saturated and C16-18-unsaturated [67701-06-8]
Fatty alcohol ethoxylates, C16–18 and C18-unsaturated [68920-66-1]
Fatty alcohols, C12-18 [67762-25-8]
1-Hexadecanol [36653-82-4]
1-Hexanol [111-27-3]
2-Hexyl-1-decanol [2425-77-6]
1-Hydroxyethyl-2-heptadecenyl-imidazoline [21652-27-7]
1-Hydroxyethylidene-1,1-diphosphonic acid [2809-21-4] and its sodium and potassium salts
2-Hydroxymethyl-2-nitro-1,3-propanediol [126-11-4]
use forbidden as component of metal-working fluids and corrosion inhibitors: see "GefStoffV 2010, Anhang II (zu §16 Absatz 2), Nr. 4"
12-Hydroxystearic acid [106-14-9]
Isononanoic acid [3302-10-1; 26896-18-4]
Isooctadecanol [27458-93-1]
Isotridecanol [27458-92-0]
Lithium-12-hydroxystearate [7620-77-1]
Lithium stearate [4485-12-5]
Methyl-1H-benzotriazole [29385-43-1]
4,4'-Methylenebis(2,6-di-tert-butylphenol) [118-82-1]
N,N'-Methylenebis(5-methyloxazolidine) [66204-44-2]
2-Methyl-4-isothiazolin-3-one [2682-20-4]
6-[(4-Methylphenyl)sulfonylamino]hexanoic acid [78521-39-8]
Myristic acid [544-63-8]
3-Nitrobenzoic acid [121-92-6]
(4-Nonylphenoxy)acetic acid [3115-49-9]
1-Octadecanol [112-92-5]
2-Octyl-1-dodecanol [5333-42-6]
Oleic acid [112-80-1]
Oleyl alcohol [143-28-2]
Palmitic acid [57-10-3]
Petroleum sulfonates, sodium salts [68608-26-4]
Phenothiazine [92-84-2]
phototoxic effect
1-Phenoxy-2-propanol [770-35-4]
2-Phenyl-1-ethanol [60-12-8]
Piperazine [110-85-0]
Use in metal-working fluids is not permitted: see TRGS 611. Reaction with nitrosating agents can result in the formation of carcinogenic
```

N,N'-dinitrosopiperazine, see Section III "Amines which form carcinogenic nitrosamines on nitrosation".

Polybutenes and polyisobutenes

Polydimethyl siloxanes, linear [63148-62-9; 9006-65-9; 9016-00-6]

Polyethylene glycol (average molecular weight > 600) [25322-68-3]

Polyethylenepolypropylene glycol [9003-11-6]

Polyoxyethylene oleyl ether [9004-98-2]

Polypropylene glycol (PPG) [25322-69-4]

Poly(propylene glycol) n-butyl ether [9003-13-8]

Propylene glycol [57-55-6]

Pyrrolidine [123-75-1]

Use in metal-working fluids is not permitted: see TRGS 611. Reaction with nitrosating agents can result in the formation of carcinogenic N-nitrosopyrrolidine, see Section III "Amines which form carcinogenic nitrosamines on nitrosation".

Sebacic acid [111-20-6]

Stearic acid [57-11-4]

Tall oil, distilled [8002-26-4]

1-Tetradecanol [112-72-1]

Tetrahydrobenzotriazole [6789-99-7]

Triazinetriyltriiminotrishexanoic acid [80584-91-4]

Triethylene glycol n-butyl ether [143-22-6]

Tris(2,4-ditert-butylphenyl) phosphite [31570-04-4]

Tris[(2- or 4-)C9-C10-isoalkylphenyl]phosphorothioate [126019-82-7]

Tris(nonylphenyl) phosphite [26523-78-4]

Zinc, O,O'-di-2-ethylhexyl dithiophosphate [4259-15-8]

# c) Substances for which the MAK value and classifications have been withdrawn

For the following substances the Commission has decided to withdraw the previous MAK values, designations and classifications because the earlier evaluation does not reflect the current data. A new evaluation has not yet been carried out and is not a priority.

Aldrin [309-00-2]

Carbaryl (1-naphthyl methylcarbamate) [63-25-2]

BLW for acetylcholinesterase inhibitors still valid; see Section XII.

Chlordane [57-74-9]

DDT (Dichlorodiphenyltrichloroethane) [50-29-3]

Demeton-methyl [8022-00-2]

BLW for acetylcholinesterase inhibitors still valid; see Section XII.

Dichlorofluoromethane [75-43-4]

1,2-Dichloro-1,1,2,2-tetrafluoroethane [76-14-2]

Dieldrin [60-57-1]

EPN (O-Ethyl O-(4-nitrophenyl)phenylthiophosphonate) [2104-64-5]

BLW for acetylcholinesterase inhibitors still valid; see Section XII.

Fenthion [55-38-9]

BLW for acetylcholinesterase inhibitors still valid; see Section XII.

Malathion [121-75-5]

BLW for acetylcholinesterase inhibitors still valid; see Section XII.

Mevinphos [7786-34-7]

see documentation "Phosdrin"

BLW for acetylcholinesterase inhibitors still valid; see Section XII.

Paraquat dichloride [1910-42-5]

Parathion [56-38-2]

BLW for acetylcholinesterase inhibitors still valid; see Section XII.

Propoxur [114-26-1]

BLW for acetylcholinesterase inhibitors still valid; see Section XII.

TEPP (O,O,O,O-tetraethylpyrophosphate) [107-49-3]

BLW for acetylcholinesterase inhibitors still valid; see Section XII.

Trichloronitromethane [76-06-2]

#### III. **Carcinogenic Substances**

Advances in our understanding of the modes of action and potency of carcinogens have made possible the improved differentiation of carcinogenic substances. Therefore, in 1998 an extended classification scheme was introduced<sup>27</sup>). The sections of the List of MAK and BAT Values previously called IIIA1, IIIA2 and III B were renamed as Categories 1, 2 and 3 of Section III and two new categories, 4 and 5, were added.

Substances which have been shown to be carcinogenic in man or in experimental animals are classified in the Categories 1 or 2 and are not assigned MAK or BAT values. Suspected carcinogens are classified in Category 3 and are assigned a MAK or BAT value only if neither the substance nor any of its metabolites is genotoxic or the genotoxic effect is not the main effect.

In the Categories 4 and 5 are classified substances with carcinogenic properties for which the available data are sufficient for assessment of the carcinogenic potency. For these substances an occupational exposure level (MAK or BAT value) is defined at which no or at most a very slight contribution to the cancer risk of the exposed persons is to be expected. The substances classified in Category 4 are known to act typically by non-genotoxic mechanisms. Category 5 contains genotoxic carcinogens of weak potency. For the monitoring of exposure to these substances, the establishment of BAT values is of particular importance.

#### Category 1

Substances that cause cancer in man and can be assumed to contribute to cancer risk. Epidemiological studies provide adequate evidence of a positive correlation between the exposure of humans and the occurrence of cancer. Limited epidemiological data can be substantiated by evidence that the substance causes cancer by a mode of action that is relevant to man.

```
Aflatoxins [1402-68-2]
4-Aminobiphenyl [92-67-1]
Arsenic [7440-38-2] and inorganic arsenic compounds (except for arsine)
Asbestos (fibrous dust) [1332-21-4]
Actinolite, Amosite, Anthophyllite, Chrysotile, Crocidolite and Tremolite
Cigarette smokers bear an increased risk of bronchial cancer.
```

Dusts have been shown epidemiologically to be unequivocally carcinogenic. The active carcinogenic principle has not been identified to date.

```
Benzene [71-43-2]
Benzidine [92-87-5] and its salts
Beryllium [7440-41-7] and its inorganic compounds
Bis(β-chloroethyl)sulfide (mustard gas) [505-60-2]
Bischloromethyl ether (Dichlorodimethylether) [542-88-1]
not to be confused with the asymmetric (Dichloromethyl)methyl ether
Brown coal tars (soft coal tars)
1,3-Butadiene [106-99-0]
Cadmium [7440-43-9] and its inorganic compounds (inhalable fraction)
α-Chlorinated toluenes:
   mixture of benzoyl chloride [98-88-4],
   benzyl chloride [100-44-7],
   benzyl dichloride [98-87-3],
   benzyl trichloride [98-07-7]
4-Chloro-o-toluidine [95-69-2]
Chromium(VI) compounds (inhalable fraction)
```

Coal tars, coal tar pitches, coal tar oils

Coke oven emissions

1,2-Dichloropropane [78-87-5]

Erionite (fibrous dust) [12510-42-8]

Hard metal containing tungsten carbide and cobalt (inhalable fraction)

Methylarsenic compounds

N-Methyl-bis(2-chloroethyl)amine (nitrogen mustard) [51-75-2]

Monochlorodimethyl ether [107-30-2]

The classification in Category 1 applies to technical monochlorodimethyl ether which can be contaminated with up to 7% bischloromethyl ether.

2-Naphthylamine [91-59-8]

Nickel and nickel compounds (inhalable fraction)

Regarding compounds which have been found to be unequivocally carcinogenic in man, see documentation.

Oak wood dust

Dusts have been shown epidemiologically to be unequivocally carcinogenic. The active carcinogenic principle has not been identified to date.

N-Phenyl-2-naphthylamine [135-88-6]

1,3-Propane sultone [1120-71-4]

Sidestream smoke (passive smoking at the workplace)

Silica, crystalline (respirable fraction)

o-Toluidine [95-53-4]

Trichloroethene [79-01-6]

Vinyl chloride [75-01-4]

#### Category 2

Substances that are considered to be carcinogenic for man because sufficient data from long-term animal studies or evidence from animal studies substantiated by evidence from epidemiological studies indicate that they can contribute to cancer risk. Limited data from animal studies can be supported by evidence that the substance causes cancer by a mode of action that is relevant to man and by results of in vitro tests and short-term animal studies.

Acrylamide [79-06-1]

Acrylonitrile [107-13-1]

Allyl glycidyl ether [106-92-3]

Aluminium oxide (fibrous dust) [1344-28-1]

Aluminium silicate fibres (RCF)

Cristobalite can develop from aluminium silicate fibres used in building materials under thermal load, see documentation.

o-Aminoazotoluene [97-56-3]

6-Amino-2-ethoxynaphthalene [293733-21-8]

o-Anisidine [90-04-0]

Anthanthrene [191-26-4]

Antimony [7440-36-0] and its inorganic compounds (except for stibine)

Attapulgite (fibrous dust) [12174-11-7]

Auramine [492-80-8]

Auramine hydrochloride [2465-27-2]

Benzo[a]anthracene [56-55-3]

Benzo[b]fluoranthene [205-99-2]

Benzo[j]fluoranthene [205-82-3]

Benzo[k]fluoranthene [207-08-9]

Benzo[b]naphtho[2,1-d]thiophene [239-35-0]

Benzo[a]pyrene [50-32-8]

★ Benzyl alcohol mono(poly)hemiformal [14548-60-8]

releases formaldehyde

Prerequisite for Category 4 in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value.

Benzyl chloride [100-44-7] see also  $\alpha$ -Chlorinated toluenes

Benzyl dichloride [98-87-3] see also  $\alpha$ -Chlorinated toluenes

Benzyl trichloride [98-07-7] see also  $\alpha$ -Chlorinated toluenes

★ N,N-Bis(2-ethylhexyl)-(1,2,4-triazole-1-yl)methanamine [91273-04-0]

releases formaldehyde

Prerequisite for Category 4 in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value.

1,3-Bis(hydroxymethyl)urea [140-95-4]

releases formaldehyde

Prerequisite for Category 4 in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value.

Bismorpholinomethane [5625-90-1]

releases formaldehyde

Prerequisite for Category 4 in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value.

Bitumen (high-temperature processing, vapours and aerosols) [64742-93-4] (bitumen, oxidized)

Bromodichloromethane [75-27-4]

Bromoethane [74-96-4]

1-Bromopropane [106-94-5]

2,4-Butane sultone [1121-03-5]

Butanone oxime [96-29-7]

1,2-Butylene oxide [106-88-7]

Carbamic acid ethyl ester [51-79-6]

Chlordecone [143-50-0]

Chlorinated camphene [8001-35-2]

p-Chloroaniline [106-47-8]

p-Chlorobenzotrichloride [5216-25-1]

1-Chloro-2,3-epoxypropane (Epichlorohydrin) [106-89-8]

Chlorofluoromethane (FC-31) [593-70-4]

N-Chloroformylmorpholine [15159-40-7]

Chloroprene [126-99-8]

Chrysene [218-01-9]

Cobalt [7440-48-4] and cobalt compounds (inhalable fraction)

Cyclopenta[cd]pyrene [27208-37-3]

Dawsonite (fibrous dust) [12011-76-6]

2,4-Diaminoanisole [615-05-4]

4,4'-Diaminodiphenylmethane [101-77-9]

1,5-Diaminonaphthalene [2243-62-1]

Diazomethane [334-88-3]

Dibenzo[a,h]anthracene [53-70-3]

Dibenzo[a,e]pyrene [192-65-4]

Dibenzo[a,h]pyrene [189-64-0]

Dibenzo[a,i]pyrene [189-55-9]

Dibenzo[a,l]pyrene [191-30-0]

1,2-Dibromo-3-chloropropane [96-12-8]

1,2-Dibromoethane [106-93-4]

Dichloroacetylene [7572-29-4]

3,3'-Dichlorobenzidine [91-94-1]

1,4-Dichloro-2-butene [764-41-0]

1,2-Dichloroethane [107-06-2]

1,1-Dichloroethene [75-35-4]

1,3-Dichloro-2-propanol [96-23-1]

1,3-Dichloropropene (cis and trans) [542-75-6]

Diesel engine emissions

Because of the new diesel engine technology the emissions have changed significantly in quality and quantity. Since it must be assumed that these new diesel engines were introduced at the end of the 1990s, all the available epidemiological studies which were evaluated in 2007 are based on exposures to emissions from older diesel engines. The emissions from the new diesel engines can not be evaluated until appropriate studies become available.

Diethyl sulfate [64-67-5]

Diglycidyl resorcinol ether [101-90-6]

3,3'-Dimethoxybenzidine [119-90-4]

3,3'-Dimethylbenzidine [119-93-7]

Dimethylcarbamoyl chloride [79-44-7]

1,1-Dimethylhydrazine [57-14-7]

1,2-Dimethylhydrazine [540-73-8]

★ 1,3-Dimethylol-5,5-dimethyl hydantoin [6440-58-0]

releases formaldehyde

Prerequisite for Category 4 in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value.

N,N-Dimethyl-p-toluidine [99-97-8]

Dimethylsulfamoyl chloride [13360-57-1]

Dimethyl sulfate [77-78-1]

Dinitrotoluene (mixtures of isomers) [25321-14-6]

III. Carcinogenic Substances Ethylene oxide [75-21-8] Ethylenimine [151-56-4] Glass fibres, biopersistent (fibrous dust) Glycidol [556-52-5] Glycidyl trimethylammonium chloride [3033-77-0] Hexamethylphosphoric acid triamide [680-31-9] Hydrazine [302-01-2] Hydrazobenzene [122-66-7] Hydroquinone [123-31-9] Indeno[1,2,3-cd]pyrene [193-39-5] Indium [7440-74-6] and its inorganic compounds Iodomethane [74-88-4] Methenamine 3-chloroallylchloride [4080-31-3; 51229-78-8] releases formaldehyde Prerequisite for Category 4 in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value. 5-Methyl-o-anisidine [120-71-8] 4,4'-Methylenebis(2-chloroaniline) (MOCA) [101-14-4] 4,4'-Methylenebis(N,N-dimethylaniline) [101-61-1] 4,4'-Methylenebis(2-methylaniline) [838-88-0] N-Methylolchloroacetamide [2832-19-1] releases formaldehyde Prerequisite for Category 4 in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value. 1-Methylpyrene [2381-21-7] Michler's ketone [90-94-8] Monomethylhydrazine [60-34-4] Naphthalene [91-20-3] 5-Nitroacenaphthene [602-87-9] 2-Nitroanisole [91-23-6] 4-Nitrobiphenyl [92-93-3] 4-(2-Nitrobutyl)morpholine (70% w/w) and 4,4'-(2-ethyl-2-nitro-1,3-propanediyl)bismorpholine (20% w/w) [2224-44-4; 1854-23-5] (mixture) In this mixture formaldehyde can be released and nitrosamines formed. Use forbidden as component of metal-working fluids and corrosion inhibitors: see "GefStoffV 2010, Anhang II (zu §16 Absatz 2), Nr. 4". Prerequisite for Category 4 in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value. 2-Nitronaphthalene [581-89-5] 2-Nitropropane [79-46-9] N-Nitrosodi-n-butylamine [924-16-3] N-Nitrosodiethanolamine [1116-54-7] N-Nitrosodiethylamine [55-18-5] N-Nitrosodiisopropylamine [601-77-4] N-Nitrosodimethylamine [62-75-9] N-Nitrosodi-n-propylamine [621-64-7] N-Nitrosoethylphenylamine [612-64-6] N-Nitrosomethylethylamine [10595-95-6] N-Nitrosomethylphenylamine [614-00-6] N-Nitrosomorpholine [59-89-2] N-Nitrosopiperidine [100-75-4] N-Nitrosopyrrolidine [930-55-2] 2-Nitrotoluene [88-72-2] 5-Nitro-o-toluidine [99-55-8] Ochratoxin A [303-47-9] 4,4'-Oxydianiline [101-80-4] Pentachlorophenol [87-86-5] Phenyl glycidyl ether (PGE) [122-60-1] Potassium titanates (fibrous dust) several CAS Nos and formulas β-Propiolactone [57-57-8] Propylene imine [75-55-8] Rock wool (fibrous dust) Silicon carbide (fibrous dust) [409-21-2] (including whiskers) Tetrabromobisphenol A [79-94-7]

Prerequisite for Category 4 in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value.

Tetrafluoroethene [116-14-3] Tetranitromethane [509-14-8]

```
4,4'-Thiodianiline [139-65-1]
2,4-Toluenediamine [95-80-7]
2,3,4-Trichloro-1-butene [2431-50-7]
1,2,3-Trichloropropane [96-18-4]
1,3,5-Triethylhexahydro-1,3,5-triazine [7779-27-3]
releases formaldehyde
Prerequisite for Category 4 in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value.
2,4,5-Trimethylaniline [137-17-7]
2,4,6-Trinitrotoluene [118-96-7]
N,N',N''-Tris(β-hydroxyethyl)hexahydro-1,3,5-triazine [4719-04-4]
releases formaldehyde
Prerequisite for Category 4 in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value.
N,N',N''-Tris(\beta-hydroxypropyl)hexahydro-1,3,5-triazine [25254-50-6]
releases formaldehyde
Prerequisite for Category 4 in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value.
Uranium [7440-61-1] and its hardly soluble inorganic compounds
4-Vinylcyclohexene [100-40-3]
4-Vinyl-1-cyclohexene dioxide [106-87-6]
2,4-Xylidine [95-68-1]
2,6-Xylidine [87-62-7]
```

For substances in Categories 1 and 2, exposure to which is considered to involve a distinct cancer risk for man, no MAK value is listed in Section IIa since a safe concentration range cannot be given. For some of these substances, even uptake through the intact skin is very dangerous. Substances in Categories 1 or 2, for which, as a result of the mechanism of action, a dose or concentration without carcinogenic effects, a "No Adverse Effect Level" (NAEL), can be expected, but the database is not sufficient to be able to derive a MAK value and reclassify them in Categories 4 or 5, are designated in Sections II and III of the List of MAK and BAT Values with the footnote "Prerequisite for Category 4 (or 5) in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value".

Where it is necessary to employ such substances for industrial purposes, special measures are required for protection and monitoring. These include: 1. routine analysis of the workplace air with analytical methods which are appropriate and sufficiently sensitive for the purpose; 2. special medical supervision of exposed individuals whereby, e. g., regular tests must be performed to determine whether the substance or its metabolites are detectable in the human body or whether appropriate effect parameters have been altered.

Continual technical improvements should make it possible to prevent these substances from occurring in the workplace air or from directly affecting the individual at work. Where this goal cannot presently be attained, additional protective measures are required (e. g., individual respirators and protective clothing, shorter periods in the area of danger, etc.) so that exposure is minimal. The kind of protective measures which are necessary also depends on the particular physical characteristics of the substance and on the nature and intensity of its carcinogenic effect.

# Category 3

Substances that cause concern that they could be carcinogenic for man but cannot be assessed conclusively because of lack of data. The classification in Category 3 is provisional. Substances for which the available studies have yielded evidence of carcinogenic effects that is not sufficient for classification of the substance in one of the other categories. Further studies are required before a final decision can be made. A MAK or BAT value can be established, provided no genotoxic effects have been detected for the substance or its metabolites or the genotoxic effect is not the main effect.

```
Acetamide [60-35-5]
Acrolein [107-02-8]
Allyl alcohol [107-18-6]
Allyl chloride [107-05-1]
4-Aminodiphenylamine [101-54-2]
3-Amino-9-ethylcarbazole [132-32-1]
p-Anisidine [104-94-9]
p-Aramid (fibrous dust) [26125-61-1]

* Benzophenone-3 [131-57-7]
Benzotriazole [95-14-7]
Benzoyl chloride [98-88-4] see also α-Chlorinated toluenes
Biphenyl [92-52-4]
```

Bitumen (high-temperature processing, vapours and aerosols) [8052-42-4; 64741-56-6/64742-93-4] (straight-run bitumen, air-rectified bitumen)

Bromochloromethane [74-97-5]

Bromomethane (Methyl bromide) [74-83-9]

1,4-Butane sultone [1633-83-6]

n-Butyl glycidyl ether (BGE) [2426-08-6]

tert-Butyl glycidyl ether [7665-72-7]

tert-Butyl-4-hydroxyanisole (BHA) [25013-16-5]

Calcium sodium metaphosphate (fibrous dust) [23209-59-8]

Carbon black (inhalable fraction)

Chlorinated paraffins unbranched chains, several CAS Nos, e.g. [63449-39-8]

Chlorinated paraffins form a group of compounds with different degrees and positions of chlorine substitution. Chlorinated paraffins with low chlorine content and short chain length can occur as a particle-vapour mixture, whereas chlorinated paraffins with a large quantity of chlorine or with long alkyl chains occur only as particles.

Chloroacetaldehyde [107-20-0]

2-Chloroacrylonitrile [920-37-6]

Chloroethane [75-00-3]

Rhodium [7440-16-6] and its inorganic compounds
Selenium [7782-49-2] and its inorganic compounds (as Se)
Sepiolite (fibrous dust) several CAS Nos and formulas
Slag wool (fibrous dust)
Talc [14807-96-6] (without asbestos fibres) (respirable fraction)
Tetrachloroethene [127-18-4]
Thiourea [62-56-6]
p-Toluidine [106-49-0]
Tribromomethane [75-25-2]
1,1,2-Trichloroethane [79-00-5]
Tricresyl phosphate, sum of all o-isomers [78-30-8]
Trimethyl phosphate [512-56-1]
2,4,7-Trinitrofluorenone [129-79-3]
Uranium compounds, soluble inorganic
Wood dust (except beech and oak wood dust)

The monitoring of the health of employees using substances classified in Category 3 must be intensified. In addition, the branches of industry which produce and process such substances are requested – as are all relevantly involved research laboratories – to participate in the effort to shed light on the cancer-correlation question and, where necessary, to search for harmless alternative substances.

Category 3 will be re-evaluated annually to determine whether substances must be reassigned to Categories 1 or 2, whether the database permits their transfer to one of the Categories 4 or 5 or whether they require no classification and can be dismissed completely from Section III of this list.

#### Category 4

Xylidine (isomers)

Substances that cause cancer in humans or animals or that are considered to be carcinogenic for humans and for which a MAK value can be derived. A non-genotoxic mode of action is of prime importance and genotoxic effects play no or at most a minor part, provided the MAK and BAT values are observed. Under these conditions no contribution to human cancer risk is expected. The classification is supported especially by evidence that, for example, increases in cellular proliferation, inhibition of apoptosis or disturbances in cellular differentiation are important in the mode of action. The classification and the MAK and BAT values take into consideration the manifold mechanisms contributing to carcinogenesis and their characteristic dose-time-response relationships.

Acrylic acid polymer (neutralized, cross-linked)
Aluminium and its poorly soluble compounds [7429-90-5] (inhalable fraction)
Due to particle overload effect in the lungs
Aluminium and its poorly soluble compounds [7429-90-5] (respirable fraction)
Due to particle overload effect in the lungs
α-Aluminium oxide [1302-74-5] (corundum)
except for aluminium oxide fibres and ultrafine particles; see Section Vh
Amitrole [61-82-5]
Aniline [62-53-3]
Barium sulfate [7727-43-7] (respirable fraction)
except for ultrafine particles; see Section Vh

Butylated hydroxytoluene (BHT) [128-37-0] n-Butyltin compounds (as Sn [7440-31-5])

Chlorinated biphenyls [1336-36-3]

Chlorinated biphenyls form a group of compounds with different degrees and positions of chlorine substitution; often, more than one of these substances occur simultaneously at the workplace. Chlorinated biphenyls with low chlorine content (up to 5 chlorine atoms) can occur as a particle-vapour mixture, whereas chlorinated biphenyls with a large quantity of chlorine occur only as particles.

Chloroform (Trichloromethane) [67-66-3]
Dichloroacetic acid [79-43-6] and its salts
1,4-Dichlorobenzene [106-46-7]
Di(2-ethylhexyl)phthalate (DEHP) [117-81-7]
N,N-Dimethylformamide [68-12-2]
1,4-Dioxane [123-91-1]
Dust, general limit value (respirable fraction) (biopersistent granular dusts) except for ultrafine particles; see Section Vh

200 Maximum Concentrations at the Workplace 1,2-Epoxypropane [75-56-9] Ethylbenzene [100-41-4] 5-Ethyl-3,7-dioxa-1-azabicyclo[3.3.0]octane (EDAO) [7747-35-5] releases formaldehyde (Ethylenedioxy)dimethanol [3586-55-8] releases formaldehyde Formaldehyde [50-00-0] Furan [110-00-9] Glass wool, half-life < 40 days (fibrous and granular components) Glutaraldehyde [111-30-8] Graphite [7782-42-5] (respirable fraction) except for ultrafine particles; see Section Vh Heptachlor [76-44-8] Hexachlorobenzene [118-74-1] Hexachloro-1,3-butadiene [87-68-3] α-Hexachlorocyclohexane [319-84-6] β-Hexachlorocyclohexane [319-85-7] 1,2,3,4,5,6-Hexachlorocyclohexane, techn. mixture of  $\alpha$ -HCH [319-84-6] and  $\beta$ -HCH [319-85-7] Hydrogen peroxide [7722-84-1] Lead [7439-92-1] and its inorganic compounds (inhalable fraction) except lead arsenate and lead chromate Lead compounds, organic (as lead) Lindane (γ-1,2,3,4,5,6-Hexachlorocyclohexane) [58-89-9] Magnesium oxide [1309-48-4] (respirable fraction) except for ultrafine particles; see Section Vh 4,4'-Methylene diphenyl diisocyanate (MDI) [101-68-8] (inhalable fraction) see also "polymeric MDI" Nitrilotriacetic acid [139-13-9] and its sodium salts Avoid simultaneous exposure to iron compounds (formation of FeNTA). Nitrobenzene [98-95-3] n-Octyltin compounds (as Sn [7440-31-5]) Peracetic acid [79-21-0] Perfluorooctanoic acid (PFOA) [335-67-1] and its salts o-Phenylphenol [90-43-7] see also Sodium o-phenylphenol Phenyltin compounds (as Sn [7440-31-5]) Pigment Yellow 12, Pigment Yellow 13, Pigment Yellow 83 [6358-85-6; 5102-83-0; 5567-15-7] (respirable fraction) "polymeric MDI" [9016-87-9] (inhalable fraction) see also 4,4'-Methylene diphenyl diisocyanate (MDI) "polymeric MDI" (pMDI) is a technical grade MDI, containing 30-80% w/w 4,4'-methylene diphenyl isocyanate (MDI); the remainder consists of MDI oligomers and MDI homologues. Tributyl phosphate [126-73-8]

Vanadium [7440-62-2] and its inorganic compounds (inhalable fraction)

Vinyl acetate [108-05-4]

N-Vinyl-2-pyrrolidone [88-12-0]

Zirconium dioxide [1314-23-4; 12036-23-6] (respirable fraction)

except for ultrafine particles; see Section Vh

#### Category 5

Substances that cause cancer in humans or animals or that are considered to be carcinogenic for humans and for which a MAK value can be derived. A genotoxic mode of action is of prime importance but is considered to contribute only very slightly to human cancer risk, provided the MAK and BAT values are observed. The classification and the MAK and BAT values are supported by information on the mode of action, dose-dependence and toxicokinetic data.

Acetaldehyde [75-07-0] Dichloromethane [75-09-2] Ethanol [64-17-5] Isoprene (2-methyl-1,3-butadiene) [78-79-5] Styrene [100-42-5]

For these substances, exposure at the level of the MAK value makes only a small contribution to the cancer risk. The derivation of the MAK value is described in more detail in the documentation for each substance.

The monitoring of the health of employees using substances classified in Categories 4 and 5 must be intensified since after exposures at levels exceeding the MAK or BAT value an increase in the cancer risk is conceivable.

# Groups of substances requiring special consideration

# **★** Formaldehyde releasers

Formaldehyde releasers are substances that release the biocide formaldehyde following hydrolysis. They are or were once used in aqueous metal-working fluids, adhesives, paints, disinfectants, cosmetics and for other applications.

Inhalation of formaldehyde is known to cause carcinogenic effects in the upper respiratory tract. Mechanistic data show that tumours do not form at formaldehyde concentrations that are not cytotoxic or do not increase cell proliferation in the respiratory epithelium. This effect threshold has led to the classification of formaldehyde in Carcinogen Category 4 (for details see the documentation for formaldehyde<sup>28</sup>)).

For evaluation, the formaldehyde releasers are assumed to have the same qualitative effect as that induced by formaldehyde. The decisive factor for the carcinogenicity of formaldehyde releasers is the rate at which formaldehyde is released in the respiratory tract. Therefore, the quantitative risk is assessed by evaluating not only data for the substance itself, but also data for the rate of hydrolysis, which is dependent on pH and concentration. If the substance undergoes hydrolysis in relevant amounts under physiological conditions or there are no data available for the release of formaldehyde, it is assumed that the formaldehyde is released completely in the tissues. If it is possible to rule out the induction of carcinogenic effects by the formaldehyde formed, as is the case when the formaldehyde is inactivated in the nose faster than it is released, the substance is not classified as a carcinogen.

If the data allow to derive a MAK value (inhalation study of the formaldehyde releaser or analogy to formal-dehyde), the substance is classified in Carcinogen Category 4. It must be taken into consideration that formal-dehyde occurs as a vapour. If the formaldehyde releaser occurs as an aerosol due to its low vapour pressure (see Section I: Substances that can occur simultaneously as vapour and aerosol), the effects are more severe because of impaction in the respiratory tract and a MAK value cannot be derived in analogy to the MAK value of formaldehyde. This was the case for the effects in the lungs induced by exposure to N,N',N''-tris( $\beta$ -hydroxypropyl) hexahydro-1,3,5-triazine<sup>29</sup>).

If a MAK value cannot be established, the formaldehyde releaser is classified in Carcinogen Category 2 with the footnote "Prerequisite for Category 4 in principle fulfilled, but insufficient data available for the establishment of a MAK or BAT value".

#### Carcinogenic medicines

Results from animal studies or experience of effects in man suggest that a number of medicines have carcinogenic effects<sup>30</sup>). Exposure of employees to such substances can occur during the manufacturing process, therapeutic use and in research laboratories.

<sup>30)</sup> see Henschler D, editor (1990) Carcinogenic Medicines (used for tumour therapy). MAK Value Documentation, 1986. In: Occupational Toxicants. Volume 1. Weinheim: VCH. p. 1–7. Also available from <a href="https://doi.org/10.1002/3527600418.mb0200e0001">https://doi.org/10.1002/3527600418.mb0200e0001</a>

Substances with a genotoxic therapeutic mechanism are assumed to be carcinogenic. This assumption is supported by the development of novel tumours in patients undergoing treatment with alkylating cytostatics such as cyclophosphamide, ethylenimine or chlornaphazine as well as with ointments containing arsenic or tar after use for long periods.

Consequently, it must be assumed that a hazard exists when these substances are handled occupationally. Suitable precautions must guarantee that exposure to such substances is prevented.

# Amines which form carcinogenic nitrosamines on nitrosation

Nitrosatable amines require particular attention because in the presence of nitrosating agents they may be transformed into potentially strongly carcinogenic nitroso compounds. A detailed account of "Nitrosation of volatile amines at the workplace" may be found online<sup>31</sup>).

The formation of nitrosamines from such amines has not only been observed in model experiments but – at least for some of the compounds – has also been demonstrated at the workplace. The amine-containing substances and end products handled at work can themselves be contaminated to a considerable extent with the corresponding nitrosamines. Under conditions encountered in practice nitrosation is to be expected particularly with secondary amines, although in principle, primary and tertiary amines may also undergo nitrosation reactions. Nitrogen oxides are the most probable nitrosating agents. In addition, nitrosation of amines may be brought about by nitrosyl chloride, nitrite esters, metal nitrites and nitroso compounds.

The potential danger associated with any particular amine arises on the one hand from the readiness with which it undergoes nitrosation reactions, and on the other from the degree of carcinogenicity of the corresponding nitrosamine. For both parameters considerable differences are to be found between the various amines. In model studies several factors such as pH, temperature, catalysts and inhibitors are known to determine the extent of nitrosation. Nitrosation of amines can take place not only in acid milieu but also in alkaline. Because nitrogen oxides are effective nitrosating agents also in alkaline milieu, when nitrosatable amines are present nitrogen oxides should be excluded. The reaction of nitrite with nitrosatable amines is accelerated by the presence of formaldehyde, which also causes extension towards the alkaline of the pH range in which significant levels of nitrosation are possible (see documentation of MAK values<sup>32</sup>) "Kühlschmierstoffe" (Metal-working fluids)). At present, however, it is not possible to make quantitative predictions as to the formation of nitrosamines under the complex conditions found at the workplace and in mixtures of substances found there. Two precautionary measures are therefore necessary when handling amines at the workplace:

- 1. Simultaneous exposure to nitrosating agents should be reduced to a minimum. This can be put into practice by eliminating nitrosating agents, or if they play a role in the actual process by replacing them with substances which do not lead to the formation of carcinogenic nitrosamines. In particular, the level of nitrogen oxides at the workplace should be monitored and reduced when necessary.
- 2. The level of nitrosamines in the workplace air and in substances containing amines should be monitored. This applies particularly when amines are used from which highly carcinogenic nitroso compounds, e. g., nitrosodimethylamine or nitrosodiethylamine, can be formed.

# Monocyclic aromatic amino and nitro compounds

The List of MAK and BAT Values includes more than 30 monocyclic aromatic amino and nitro compounds, most of which are classified in Categories 1 to 3 for carcinogenic substances, but there are also some with MAK values and others for which no MAK value could be established and which are therefore listed in Section IIb of the List of MAK and BAT Values. Comparison of these compounds (see documentation "Monocyclic aromatic amino and nitro compounds" 2005<sup>33</sup>)) reveals that their acute and chronic toxic effects are very similar. When they are tested with appropriate methods, they may be shown to have carcinogenic potential (Categories 1 or 2) or at least to be suspected carcinogens (Category 3). And the substances all cause very similar kinds of tumours. The substances are generally only weakly genotoxic. Therefore, it is considered that the acute toxic effects play an important role, a role in tumour promotion. The creation of the Categories 4 and 5 for carcinogenic substances made it necessary to review the contribution of genotoxic and non-genotoxic properties to the carcinogenicity of (especially) suspected carcinogens

<sup>&</sup>lt;sup>31</sup>) Henschler D, editor (1990) Nitrosation of volatile amines at the workplace. MAK Value Documentation, 1984. In: Occupational Toxicants. Volume 1. Weinheim: VCH. p. 23–37. Also available from <a href="https://doi.org/10.1002/3527600418.mb0b03e0001">https://doi.org/10.1002/3527600418.mb0b03e0001</a>

<sup>&</sup>lt;sup>32</sup>) available online under <a href="https://mak-dfg.publisso.de">https://mak-dfg.publisso.de</a>

<sup>33)</sup> Greim H, editor (2005) Monocyclic aromatic amino and nitro compounds. MAK Value Documentation, 2003. In: The MAK-Collection for Occupational Health and Safety. Part I: MAK Value Documentations. Volume 21. Weinheim: Wiley-VCH. p. 3–45. Also available from <a href="https://doi.org/10.1002/3527600418.mb0maryvere0021">https://doi.org/10.1002/3527600418.mb0maryvere0021</a>

(substances in Category 3) and to decide whether they could be reclassified in one of the new categories. In addition, inconsistencies in the classification of these substances had become apparent. Because there is frequently insufficient information available for the classification of individual substances, it seems sensible to draw conclusions on the basis of analogy with structurally related compounds. The comparison reveals that this is possible within certain limits but that, in the absence of appropriate data, it is not possible to decide with any certainty where a substance belongs in the spectrum between weak and powerful carcinogens.

Practically all the monocyclic aromatic amino and nitro compounds reviewed here are methaemoglobin producers and most cause haemosiderosis. This suggests that the N-hydroxylamines formed from the compounds are responsible for the toxic effects in experimental animals and in man. It has, however, not yet been demonstrated whether the observed differences between sexes and species and in target organs may all be explained in terms of toxicokinetically induced differences in the bioavailability of the effective metabolites. It is also not clear whether the genotoxic or acute toxic effects are influenced by the release of iron during methaemoglobin formation or erythrocyte turnover and by the "oxidative stress" associated with these processes.

In any case, toxic tissue changes and fibrosis precede tumour development in the spleen, liver and kidneys.

Genotoxic effects have been demonstrated for many monocyclic aromatic amino and nitro compounds and are likely for others. Because of this (albeit weak) genotoxicity, a classification in Category 5 for carcinogenic substances could seem appropriate. However, there is considerable evidence that tissue damage is decisive for the tumour development and that the substances should be classified in Category 4. But such a classification requires that the causes and dose-dependence of the tissue damage are understood.

The comparison of these substances also indicates that the haematotoxic members of the group must generally be seen to be risk factors for cancer and should be re-examined to decide whether they should be classified in one of the categories for carcinogenic substances.

#### Azo colourants

Azo colourants are characterised by the azo group —N=N—. They are made by the coupling of singly and multiply diazotized aryl amines. Of particular toxicological importance are colourants from doubly diazotized benzidine and benzidine derivatives (3,3′-dimethylbenzidine, 3,3′-dimethoxybenzidine, 3,3′-dichlorobenzidine). In addition, aminoazobenzene, aminonaphthalene and monocyclic aromatic amines are encountered. Reductive fission of the azo group, either by intestinal bacteria or by azo reductases of the liver and of extrahepatic tissues, can cause these compounds to be released. Such breakdown products have been detected in animal experiments as well as in man (urine). Mutagenicity, which has been observed with numerous azo colourants in in vitro test systems, and the carcinogenicity in animal experiments are attributed to the release of amines and their subsequent metabolic activation. There are now epidemiological indications that occupational exposure to benzidine-based azo colourants can increase the incidence of bladder carcinoma.

Thus all azo colourants whose metabolism can liberate a carcinogenic aryl amine are suspected of having carcinogenic potential. Due to the large number of such dyes (several hundred) it seems neither possible nor justifiable to substantiate this suspicion in each individual case by means of animal experimentation according to customary classification criteria. Instead, scientific models have to be relied on. Therefore, as a preventive measure to avoid putting exposed persons at risk, it is recommended that the substances be dealt with as if they were classified in the same categories as the corresponding carcinogenic or suspected carcinogenic amines (Categories 1, 2, 3). If there are indications that the colourant itself (e. g. a pigment) or any carcinogenic breakdown product is not biologically available, the absence of risk should be proved experimentally or substantiated by biomonitoring. Suitable animal experiments can also rule out a suspected carcinogenic potential.

#### Pyrolysis products of organic materials

If organic material is heated or combusted with a limited supply of oxygen, mixtures are produced whose compositions are dependent on the starting material and the reaction conditions. These mixtures contain, among numerous other substances, polycyclic aromatic hydrocarbons (PAH).

The extremely complex mixtures which have been examined to date contain, simultaneously and in widely differing proportions, carcinogenic components and substances which promote cancer development, as well as fractions which inhibit the carcinogenic effects of concurrently present components.

Many of the PAH which occur regularly in pyrolysis products are carcinogenic in animal studies. They are present at particularly high levels in

brown coal tars (soft coal tars), coal tars (black coal tars), coal tar pitches, coal tar oils, coke oven emissions.

The carcinogenic effect after occupational exposures to these mixtures of aromatic compounds has been demonstrated in epidemiological studies. Therefore, they are classified in

#### Category 1.

Particularly the local carcinogenic effects of these mixtures are accounted for largely in terms of their content of PAH. Such effects are therefore also to be expected with other PAH-containing mixtures. The levels and significance of other carcinogenic components of these mixtures has not yet been studied in detail. Thus, although diesel engine emissions<sup>34</sup>)

also contain PAH, in this case it is probably the soot particles which determine the carcinogenic effect. This has been demonstrated only in animal studies and therefore diesel engine emissions are classified in **Category 2.** 

The carcinogenic effects of other mixtures such as, e. g., petrol engine emissions, used motor oils, curing smoke, used cutting oils, have not yet been studied in as much detail. The composition of these mixtures also makes them difficult to define. If, however, exposure to PAH which have been shown in animal studies to be carcinogenic, e. g.,

anthanthrene, benzo[a]anthracene, benzo[b]fluoranthene, benzo[j]fluoranthene, benzo[k]fluoranthene, benzo[b]naphtho[2,1-d]thiophene, benzo[a]pyrene, chrysene, cyclopenta[cd]pyrene, dibenzo[a,h]anthracene, dibenzo[a,e]pyrene, dibenzo[a,h]pyrene, dibenzo[a,i]pyrene, dibenzo[a,l]pyrene, indeno[1,2,3-cd]pyrene, 1-methylpyrene, naphthalene,

can be demonstrated during work with such pyrolysis products, the mixtures should be handled

**like the substances in Category 2**, except for phenanthrene and pyrene, which are not classified in a Carcinogen category on the basis of the data (see documentation "Polycyclic aromatic hydrocarbons (PAH)" 2012<sup>35</sup>)).

It will be possible to establish a clearer, more quantitative relationship between exposure and an increase in cancer risk when more precise data for the compositions of specific mixtures and of their cancer-producing effects are available (see also documentation "Polycyclic aromatic hydrocarbons (PAH)" 2012<sup>35</sup>)). The Commission emphasizes the urgency of such investigations.

Polycyclic aromatic hydrocarbons (PAH) may be readily absorbed through the skin. Therefore, pyrolysis products and other mixtures containing PAH should be handled like substances designated with an "H" (see Section VII "Percutaneous absorption"; see also documentation "Polycyclic aromatic hydrocarbons (PAH)" 2012<sup>35</sup>)).

<sup>34)</sup> Because of the new diesel engine technology the emissions have changed significantly in quality and quantity. Since it must be assumed that these new diesel engines were introduced at the end of the 1990s, all the available epidemiological studies which were evaluated in 2007 are based on exposures to emissions from older diesel engines. The emissions from the new diesel engines can not be evaluated until appropriate studies become available.

Hartwig A, editor (2012) Polycyclic aromatic hydrocarbons (PAH). MAK Value Documentation, 2008. In: The MAK-Collection for Occupational Health and Safety. Part I: MAK Value Documentations. Volume 27. Weinheim: Wiley-VCH. p. 1–216. Also available from <a href="https://doi.org/10.1002/3527600418.mb0223orge0027a">https://doi.org/10.1002/3527600418.mb0223orge0027a</a>

#### Fibrous dusts

Not only certain kinds of asbestos but also the fibrous zeolite, **erionite**, is considered to produce tumours in man. In addition, a number of fibrous dusts have been shown to produce tumours in experimental animals after inhalation or after intratracheal instillation or direct local administration into the chest (intrapleural) or abdominal (intraperitoneal) cavity.

When all the information as to the effects of dust on man and the effects seen in studies with animals and cultured cells is taken into account, it must be concluded that, unlike the non-fibrous insoluble dusts of corresponding composition,

- the fibrous asbestos dust particles which are durable in the organism must be seen as the cause of the tumorigenic effects of asbestos
- and that, in principle, all kinds of elongated dust particles have the potential, like asbestos fibres, to cause tumours if they are sufficiently long, thin and durable in vivo.

Factors also suggested to play a role include other properties of fibres such as their surface characteristics.

The animal studies have also demonstrated that longer or more durable fibres have higher carcinogenic potency than shorter or less durable fibres.

#### Classification criteria

# a) Properties of carcinogenic fibres

According to the internationally accepted convention established in the 1960s for measuring levels of asbestos dust at workplaces by counting the fibres under the light microscope, only particles with a ratio of length to diameter greater than 3:1 and which are longer than 5  $\mu$ m and have a diameter less than 3  $\mu$ m are counted. The term fibrous dust is used here for fibres of these dimensions. With such fibrous dusts in animal studies, the number of fibres has been shown to correlate positively with the tumour incidence.

The above definition, however, does not distinguish clearly between carcinogenic and non-carcinogenic fibres. The presently available data do not make it possible to state precisely from which fibre length or diameter or from which length to diameter ratio and from which durability fibres possess the biological activity resulting in tumour induction. Nevertheless, at present there is no other definition which has a better scientific basis.

The situation is made more difficult by the fact that, with the exception of a few inorganic and organic textile fibres, fibrous materials produce dusts in which the fibre lengths and diameters are spread over a wide range.

In addition, the diameter of fibres, e. g., asbestos fibres, can be reduced after incorporation by longitudinal splitting. Then fibres with diameters less than 3  $\mu$ m can be found in the lungs although, before splitting, the fibres in the inhaled air did not fit the definition of fibrous dust.

#### b) Effects in man

Epidemiological studies of the inhabitants of three villages in central Anatolia together with mineralogical studies and analyses of the fibres in lung dust produced convincing evidence that erionite fibres cause mesothelioma and lung cancer.

In epidemiological studies carried out in factories producing glass fibre and glass wool, no convincing evidence of an increased risk of developing mesothelioma or lung cancer was found. An increased risk of developing lung cancer was found for persons exposed to rock and slag wool but could not be associated unequivocally with the exposure to these fibrous dusts.

The studies available to date neither confirm nor refute the proposal that man-made mineral fibres have carcinogenic effects but this was not to be expected since, even if the individual fibres were as carcinogenic as asbestos fibres, the tumorigenicity would not be detectable at the low exposure concentrations measured in these studies. At present there are no appropriate studies of workplaces where persons processing or using fibres are exposed to the much higher fibre concentrations necessary to examine with sufficient sensitivity the question of the carcinogenic effects in man.

#### c) Animal inhalation studies

The results of inhalation studies with fibrous dusts are not always consistent so that positive results obtained in some studies could not be confirmed in others. The main reason for this inconsistency is that it is difficult to ensure that a sufficient dose of the carcinogenic fibre fraction reaches the target tissue. The fibres which are relevant for the effects in man, for example, penetrate the nasal filter of rodents either only poorly or not at all. For crocidolite, which has

been shown to be carcinogenic in man, positive results have been obtained in only one adequately documented inhalation study with rats but negative results in several adequately documented studies.

Thus a negative result in an inhalation study does not exclude the possibility that the substance has carcinogenic effects. Positive results in the lung must be analysed to determine whether overloading has occurred.

#### d) Animal studies with intratracheal instillation, intrapleural or intraperitoneal injection

Many kinds of fibre have proved to be carcinogenic after administration by intratracheal instillation or by intrapleural or intraperitoneal injection. These administration routes are unphysiological but they guarantee a high dose of fibres immediately after application at the sites which are relevant for man (bronchial tract, pleura and peritoneum). Thus, in the studies with intratracheal, intraperitoneal or intrapleural administration, a longer time and higher dose is available for tumour production than in inhalation studies where the fibre concentration in the target organs builds up only slowly.

With these methods, dose-response relationships can be established; they have demonstrated that the carcinogenic effect is determined by the form of the fibre. Inhalation studies with selected ceramic fibres have confirmed positive results obtained in injection studies. Although the possibility of overloading the target tissue cannot be excluded with these administration routes, a positive result from such a study is considered to be good evidence that the fibre would be carcinogenic in man.

#### e) Genotoxicity and cell transformation studies

Genotoxicity and cell transformation studies with various fibres also demonstrate that fibre form largely determines the effects of fibres. Whereas numerical and structural chromosome changes were detected in a number of test systems, there was no conclusive evidence that fibres can induce point mutations.

# f) Durability

From the results of animal studies with durable and non-durable fibres it is concluded that durability in the biological system has a considerable effect on the carcinogenicity of fibres. At present, however, it is not possible to define the degree of durability necessary for carcinogenic activity or to state to what extent the durability determines the carcinogenic potency of the fibres. Gypsum and wollastonite, e. g., dissolve in the organism within a period of some days to a few weeks and show no signs of carcinogenic effects even after intraperitoneal administration.

#### g) Mechanism

The mechanism of the toxicity and carcinogenicity of fibres is very complex and many aspects are unclear.

The formation of tumours in the lungs and on serous skin is mainly the result of inflammatory processes. Chronic inflammation and cell proliferation are caused by the impairment of fibre clearance; whereby inflammation-promoting cytokines, growth factors, reactive oxygen (ROS) and nitrogen species (RNS), and chlorine radicals are released from macrophages, alveolar cells and mesothelial cells. The generation of these radicals leads to indirect genotoxic effects.

Additional mechanistic aspects are:

- the formation of ROS and RNS caused by the fibres themselves,
- the absorption of the fibres into the target cells by means of endocytosis, whereby ROS and RNS are released intracellularly causing genetic and epigenetic changes, and
- the stimulation of cell receptors and inflammasomes, which in turn activate intracellular signal pathways and thus give the impulse for cell proliferation and the resistance to apoptosis.

#### Summary

The fibre dust groups will be evaluated individually, and depending on the data available and taking into consideration the mechanism of action will be classified in one of the categories for carcinogens.

The results of the evaluation of the individual fibre groups are given in List IIa "Substances with MAK values and substances listed in Sections IIb, IIc and III to XII" (see also MAK Collection "Fibrous Dusts" <sup>36</sup>).

# Organic fibrous dusts

Evaluation of the carcinogenicity of organic fibres in the critical dimension range is not possible. Studies are necessary, for example of carcinogenicity, surface characteristics, bioavailability and durability, to enable assessment of the carcinogenic effects of organic fibres.

# IV. Sensitizing substances

The allergies caused by substances at the workplace affect mostly the skin (contact eczema, contact urticaria), the respiratory passages (rhinitis, asthma, alveolitis) and the conjunctiva (blepharoconjunctivitis). The kind of allergy is determined by the route of uptake, the chemical properties of the substance and its aggregation state.

Contact allergies are generally manifested as contact eczema, the pathogenesis of which involves a T lymphocyte-mediated immune reaction of delayed type. Contact eczema is almost always caused by reactive substances of low molecular weight. Immunologically, these low molecular weight substances must be seen as haptens, prehaptens or prohaptens. They become complete allergens in the organism either by binding to peptides or proteins as such (haptens), after activation ex vivo (prehaptens) or after metabolism (prohaptens).

The development of a contact allergy of delayed type is determined by several factors, by the sensitization potential resulting from the chemical properties of the substance or the metabolites produced from it in the organism, by the exposure concentration and the duration and manner of exposure, by the genetic disposition of the person and, not least, by the state of the tissue with which the substance makes contact. The release of (pro-) inflammatory cytokines (e. g. TNF- $\alpha$  or interleukin-1 $\beta$ ), which is triggered by existing inflammation of the skin or by irritation from a foreign substance, is necessary for the induction of sensitization. Thus, the irritating properties of a substance can increase its sensitization potential. Cytokine induction, which stimulates the immune response, can also be triggered by the additional contact with other irritating substances, e. g. detergents such as sodium dodecyl sulfate, which then provide the necessary (pro-)inflammatory stimulus. Furthermore, the irritating effect of these kinds of substances leads to increased penetration of the sensitizing substance. An effect which enhances (or decreases) penetration is also possible from non-irritating substances with suitable/adequate polarity (such as dimethyl sulfoxide). These types of cofactors and combinatorial effects, as well as particular factors relevant under conditions at the workplace and expressly pointed out in the documentation, are taken into account in the evaluation, as described in Chapter IVc. The sensitization potency of a substance is not necessarily reflected in the incidence of sensitizations which it causes because the clinical significance of a contact allergen is not only determined by its sensitization potency but also by the distribution of the substance and the possibilities of exposure to it. Quantitatively, the sensitization potential of a substance can best be estimated in animal studies, in particular in the Local Lymph Node Assay (LLNA) in the mouse. At present, in vitro studies are not yet sufficiently validated for this purpose.

Other allergic skin reactions, e. g., urticaria, involve immune reactions mediated by specific antibodies. Similar symptoms can also be produced, however, by mechanisms not involving immune reactions (see below).

Most respiratory allergens are macromolecules, mainly peptides or proteins. But low molecular weight substances can also produce specific immunological reactions in the airways (see List of allergens). Some of the low molecular weight respiratory allergens are also contact allergens.

The allergic reactions of the airways and conjunctiva which take the form of bronchial asthma or rhinoconjunctivitis mostly involve reaction of the allergen with specific IgE antibodies and belong to the manifestations of immediate type. However, in the deeper airways they can also first appear after a delay of several hours. Exogenous allergic alveolitis is induced generally by allergen-specific immune complexes of IgG type and by cell-mediated reactions. Allergic reactions of immediate type can also cause systemic reactions and even anaphylactic shock.

The development of allergies of the respiratory passages, like that of contact allergies, is dependent on a number of factors. In addition to the substance-specific potential for causing sensitization, the amount of the allergen, the exposure period and the genetically determined disposition of the exposed person play a decisive role. Factors which increase the sensitivity of the mucosa may play a role in predisposing a person to allergy; they may be genetically determined or acquired, for example, during infections or exposure to irritant substances. Particular attention should be drawn to atopic diathesis which is characterized by an increased susceptibility to atopic eczema (neurodermatitis) or to allergic rhinitis and allergic bronchial asthma and is often associated with increased IgE synthesis.

In addition, there are also a number of relatively rare disorders of quite different kinds which are immunologically induced and so belong with the allergic phenomena such as, for example, manifestations involving granuloma formation (e. g. berylliosis) and certain exanthematous skin disorders.

A number of substances only induce the formation of antigens and then contact sensitization when they have previously been put into an energetically excited state by the absorption of light (photocontact sensitization, "photoallergization"). Likewise, many other substances can cause a skin reaction after exposure to light but without proof of an immunological mechanism (phototoxicity). Differentiation between phototoxicity and immunological photocontact sensitization can be difficult, as the classical factors that distinguish between (photo)allergic and (photo)toxic effects are not always found. In Anglo-American usage the expression "photosensitization" is used for both mechanisms. Although photocontact sensitization and phototoxicity involve primarily the physical activation (photosensitization) of a chromophore, both types of reactions are in principle clinically and diagnostically distinguishable.

It is still not possible to determine (and document scientifically) generally applicable threshold concentrations either for the induction of an allergy (sensitization) or for triggering the allergic reaction in an already sensitized person. The likelihood of induction increases with the concentration of the allergen to which persons are exposed. The concentrations required for the triggering of acute symptoms are generally lower than those required for sensitization. Even when MAK values are observed, the induction or triggering of an allergic reaction cannot be excluded with any certainty.

Sensitizing substances are indicated in the List of MAK and BAT Values under the abbreviation "Sens" by "Sa" or "Sh". This designation refers only to the organ or organ system in which the allergic reaction is manifested. The pathological mechanism producing the symptoms is not taken into account. "Sh" designates substances which can cause allergic reactions of the skin and the mucosa close to the skin (skin-sensitizing substances). The designation "Sa" (substances causing airway sensitization) indicates that a sensitization can involve symptoms of the airways and also of the conjunctiva, and that other effects associated with reactions of immediate type are also possible. These include systemic effects (anaphylaxis) and local effects on the skin (urticaria). The latter reactions only result in the additional designation with "Sh" when the skin symptoms are relevant under workplace conditions. Substances which increase photosensitivity in exposed persons by mechanisms not involving immune reactions (e. g. furocoumarins) are not separately designated. On the other hand, substances which cause photocontact sensitization are designated with "SP" (e. g. bithionol). Separate criteria for their evaluation are not necessary because, in essence, the criteria for the evaluation of substances causing contact sensitization may be applied.

Some substances can cause local or systemic reactions the symptoms of which are entirely or largely identical to those of allergic reactions but which do not involve specific immunological mechanisms; they involve, e. g., the release of various mediators by mechanisms which are not immunological. These reactions are not a result of antigen-antibody interactions and can therefore also appear on the very first contact with the substance. Such reactions are induced, e. g., by sulfites, by benzoic acid and acetylsalicylic acid and their derivatives and by a variety of dyes such as tartrazine. Such substances are not designated with an "S". However, attention is drawn to their potential for producing such non-immunological reactions in the documentation and in some cases in the List of MAK and BAT Values as well.

The criteria which are used in the evaluation of substances causing contact and airway sensitization are described below.

# a) Criteria for the assessment of contact allergens

The allergological evaluation is based on a variety of information which must be seen as providing different qualities of evidence.

- 1) Sufficient evidence of an allergenic effect is provided by valid results from either i) or ii):
  - i) effects in man
    - studies in which numerous clinically relevant cases of sensitization (i. e. association of symptoms and exposure) were observed in tests with large collectives of patients in at least two independent centres, or
    - epidemiological studies which reveal a relationship between sensitization and exposure, or
    - case reports of clinically relevant sensitization (association of symptoms and exposure) for more than one patient from at least two independent centres

or

- ii) results of experimental studies
  - at least one positive result in an animal study without adjuvant carried out according to accepted guidelines, or
  - positive results from at least two less well-documented animal studies carried out according to accepted guidelines, one of which did not use adjuvant.
  - at least two positive results from in vitro studies carried out according to test guidelines, in which different key events of contact sensitization were tested
- 2) An allergenic effect can be considered **probable** on the basis described in i) **and** ii) below:
  - i) effects in man
    - studies in which numerous clinically relevant cases of sensitization (association of symptoms and exposure) were observed in tests in just one centre, or
    - studies in which numerous cases of sensitization without details of clinical relevance were observed in tests with large collectives of patients in at least two independent centres

#### and

- ii) results of experimental studies
  - a positive result in an animal study with adjuvant carried out according to accepted guidelines or
  - positive results from an in vitro study carried out according to test guidelines, or
  - evidence from structural considerations based on sufficiently valid results for structurally closely related compounds.

- 3) An allergenic effect is **not sufficiently documented**, but also not excluded, when only the data listed below are available:
- insufficiently documented case reports, or
- only one positive result in an animal study with adjuvant carried out according to accepted guidelines, or
- positive results in animal studies which were not carried out according to accepted guidelines, or
- evidence from studies of structure-effect relationships or from in vitro studies not carried out according to test guidelines.

#### Commentary:

Effects in man

The data obtained in numerous clinics and allergy centres from serial patch tests give us a useful picture of the frequency of skin sensitization and of the practical importance of the individual contact allergens. In contrast, useful results of reliable epidemiological studies are available for only few allergens.

The allergens which are observed most frequently, e. g., nickel, are not always the most potent sensitizers. On the other hand, very strongly sensitizing substances such as 2,4- dinitrochlorobenzene play quantitatively only a small role because only a small number of persons have sufficiently intensive contact with them. A number of highly potent contact allergens have been identified from clinical observations obtained in only a few patients, often after the first and only exposure (sometimes even after the first patch test). Examples of such substances are chloromethylimidazoline, diphenylcyclopropenone, quadratic acid diethyl ester, p-nitrobenzoyl bromide. For such exceptional substances, given proper scientific data, the evidence could be considered as 'probable' (category a2) even when the data come from just one centre.

The results of use tests in man with substances found at the workplace – often internal studies of the producing company – are of considerable value when they are carried out properly. Nowadays, the use of experimental sensitization tests must be rejected for ethical reasons, but historical results can be of importance in the evaluation of a substance.

#### Results of experimental studies

Animal studies to determine the potential of a substance to cause allergic sensitization were carried out with guinea pigs with or without the use of Freund's complete adjuvant (FCA) and in the mouse. The most frequently used methods were the maximization test of Magnusson and Kligman (with FCA), and the Buehler test and LLNA (without FCA). The methods with FCA are generally more sensitive and their use can therefore occasionally result in overrating of the potential of sensitization. For this reason, a positive result in a test without adjuvant is considered in the test criteria to be better evidence than a positive result in one with adjuvant.

The tests with experimental animals generally yield useful data; that is, for most substances they have yielded results in agreement with the data obtained in man. One advantage of the experimental animal methods is that dose-response relationships can be studied.

The test systems used for in vitro studies refer to individual key events of the sensitization phase, such as the binding of the test substance to proteins, the activation of keratinocytes, the maturation and migration of dendritic cells or the activation and proliferation of T lymphocytes. The plausibility of positive findings from in vitro studies is examined. For this purpose, for example, the physico-chemical properties of the substances, existing knowledge of their reactivity with proteins or structure–effect relationships can be taken into consideration. An evaluation scheme in which merely a minimum number of positive findings is required is considered by the Commission to be too rigid an instrument for scientific evaluations.

Substances to which people have not yet been exposed or known to be exposed (e. g. because they have been newly synthesized or are newly available products) and for which, therefore, clinical data cannot be available (neither negative nor positive results of clinical observations can be applied as a criterion) can also be classified as probably sensitizing (category a2) simply on the basis of positive results from animal studies with adjuvant carried out according to accepted guidelines. Even plausible positive results from experimental studies not carried out according to accepted guidelines can be accepted, provided theoretical chemical structural considerations or well-founded mechanistic aspects indicate that the substance is so closely related to known allergens that it may be expected to have analogous properties.

Theoretical considerations require practical confirmation; therefore, they are generally of less importance in the final evaluation and cannot be the only criterion for a potential sensitizing effect in the absence of other clinical or experimental data.

# b) Criteria for the evaluation of respiratory allergens

The kinds of data which may be used in the evaluation of respiratory allergens are listed below; here too the different kinds of data provide different qualities of evidence.

- 1) **Sufficient evidence** of allergenic effects of a substance in the airways or the lungs is provided by valid data from:
  - studies or case reports of a specific hyperreactivity of the airways or the lungs which are indicative of an immunological mechanism from more than one patient and at least two independent testing centres. In addition, the (clinical) symptoms or adverse effects on the function of the upper or lower airways or the lungs must be shown to be associated with the exposure to the substance.
- 2) An allergenic effect can be considered **probable** on the basis of the results listed below:
  - one single case report of a specific hyperreactivity of the airways or the lungs

#### and

- other indications of sensitizing effects, e. g., a close structure-effect relationship with known airway allergens.
- 3) An allergenic effect is **not sufficiently documented**, but also not excluded, when only the data listed below are available:
  - epidemiological studies which demonstrate an increased incidence of symptoms or impaired function in exposed persons, or
  - studies or case reports of a specific hyperreactivity of the airways or the lungs in only one patient, or
  - studies or case reports of sensitization (e. g. detection of IgE) without accompanying symptoms or impairment of function causally associated with the exposure, or
  - positive results of animal studies, or
  - positive results of in vitro studies, or
  - structure-effect relationships with known respiratory allergens.

#### Commentary:

Generally, the classification is based on the results of epidemiological studies. Case reports do not always withstand critical examination, not least because of the difficulty or impossibility of carrying out adequate control studies. This is particularly true of inhalation-provocation tests. In addition, it is not always possible to produce adequate exposure data.

Symptoms are usually not a sufficient criterion for the designation of a substance as a respiratory allergen; generally, it is necessary to demonstrate sensitization and record objective changes such as exposure-related impairment of lung function or bronchial hyperreactivity to specific stimuli. An immunological mechanism can generally be recognized on the basis of in vivo (e. g. prick test) or in vitro test results, ideally by detection of a specific antibody after proved exposure.

For many substances, an immunological mechanism has not yet been demonstrated directly. Therefore, indirect evidence of immunological mechanisms can also be taken into account in classification. These include:

- the existence of a latency period between the start of the exposure and the appearance of the first symptoms (sensitization period),
- the triggering of symptoms with low concentrations of the substance which do not cause symptoms in appropriate controls,
- occasional delayed reactions or sequential immediate and delayed reactions (dual reactions) in the inhalation-provocation test,
- associated cutaneous symptoms such as urticaria or Quincke's oedema.

An allergenic effect is not sufficiently documented, but also not excluded, when evidence of airway sensitization is available but the conditions described in the criteria are not fulfilled. In particular, epidemiological studies which demonstrate an increased incidence of symptoms or of impaired function in exposed persons (even with demonstrated dose-response relationships) do not provide sufficient evidence of sensitizing properties if no indications of a specific immunological mechanism are available. Likewise, studies or case reports which merely document work-place-related variations in lung function or bronchial hyperreactivity are not sufficient.

To date there is no thoroughly validated method to induce and detect respiratory allergies in an animal model. In guinea pig models, sensitizing substances cause reactions like those seen in man. Sensitization can be induced by inhalation or by intradermal, subcutaneous injection or topical epidermal application. In these tests the respiratory hyperreactivity (respiration rate, tidal volume, respiratory minute volume, inhalation and exhalation times, exhalation rate) is measured. In the mouse IgE test, the potential of a substance to cause sensitization in BALB/c mice is determined as a function of the increase in the level of total IgE but not, to date, as a function of substance-specific IgE. In studies in rats, effects are often investigated after topical induction and inhalation challenge treatment.

With these models no observed effect levels (NOEL) can be established but it is questionable whether they apply for man. Systematic comparative tests have not yet been carried out.

To date, sensitive and specific standardized in vitro methods for detecting low molecular weight respiratory allergens (and which can differentiate between respiratory and contact allergens) are not available. In addition, it is not possible to date to give a valid assessment of the sensitizing potential of the substance (with the exception of a few classes of substances such as e. g. the diisocyanates or the dicarboxylic acid anhydrides) on the airways on the basis of structural or mechanistic properties alone. These may, however, be useful when the data from experimental studies are ambiguous.

# c) Designation of a substance as an allergen

Whether or not it is necessary to designate a substance as an allergen in the List of MAK and BAT Values is determined on the basis of the available evidence of allergenic effects and, when possible, also on the basis of the expected levels of exposure.

- The substances characterized according to the criteria in Section IVa) or IVb) as belonging in Categories 1) or 2) are generally designated as allergens with "Sa", "Sh", "Sah" or "SP".
  - Substances for which these criteria are fulfilled are also designated with an "S" when the observed sensitization is associated mainly with cofactors which are (only) relevant under workplace conditions (e. g. (previous) damage to the skin caused by chemical or physical agents).
- On the other hand, substances are not designated with an "S" when
  - in spite of extensive handling of the substance, very few (well-documented) cases of sensitization are observed, or
  - the observed cases of sensitization are mainly associated with cofactors which are not relevant under work-place conditions (e. g. the presence of eczema on the lower leg), or
  - the criteria of Section IVa) or IVb) resulted in classification of the substance in category 3). This also includes substances for which a positive result was obtained in a study with experimental animals using adjuvant (maximization test); at the same time, however, no case of contact sensitization in humans was observed despite relevant exposure. A substance is not designated with "Sa" if the reactions which occurred are caused by irritating or pharmacological effects, since these effects were taken into account in establishing a MAK value.
- Thus, in individual cases a designation which differs from the designation according to the EU regulations for hazardous substances is possible.

The criteria are to be seen as guidelines for an intelligible evaluation of the data but in certain special cases their strict application may not be obligatory.

# d) List of allergens

The list below shows the substances in Section IIa which are designated with Sa, Sh, Sah or SP. It does not claim to be a complete list of sensitizing substances and is subject to continual revision and extension.

```
Abietic acid [514-10-3] (Sh)
also includes disproportionation and transposition products
An immunological genesis of the asthma often seen in persons working with materials containing abietic acid has not been proved.
Acrylamide [79-06-1] (Sh)
Acrylic acid 2-ethylhexyl ester [103-11-7] (Sh)
Acrylic acid 2-hydroxyethyl ester [818-61-1] (Sh)
Acrylic acid hydroxypropyl ester (all isomers) [25584-83-2] (Sh)
Acrylonitrile [107-13-1] (Sh)
Alkali persulfates (Sah)
Allyl glycidyl ether [106-92-3] (Sh)
p-Aminoazobenzene [60-09-3] (Sh)
o-Aminoazotoluene [97-56-3] (Sh)
4-Aminodiphenylamine [101-54-2] (Sh)
2-Aminoethanol [141-43-5] (Sh)
2-(2-Aminoethoxy)ethanol [929-06-6] (Sh)
3-Aminomethyl-3,5,5-trimethyl-cyclohexylamine (isophorone diamine) [2855-13-2] (Sh)
3-Aminophenol [591-27-5] (Sh)
p-Aminophenol [123-30-8] (Sh)
```

```
Ammonium persulfate [7727-54-0] (Sah)
 α-Amylase (Sa)
 α-Amylcinnamaldehyde [122-40-7] (Sh)
 Aniline [62-53-3] (Sh)
 Animal hair, epithelia and other materials derived from animals (Sah)
 Azinphos-methyl [86-50-0] (Sh)
 Benomyl [17804-35-2] (Sh)
 1,2-Benzisothiazol-3(2H)-one [2634-33-5] (Sh)
★ Benzophenone-3 [131-57-7] (Sh)
 Benzyl alcohol mono(poly)hemiformal [14548-60-8] (Sh)
 releases formaldehyde
 Beryllium [7440-41-7] and its inorganic compounds (Sah)
 N,N-Bis(2-ethylhexyl)-(1,2,4-triazole-1-yl)methanamine [91273-04-0] (Sh)
 releases formaldehyde
 Bismorpholinomethane [5625-90-1] (Sh)
 releases formaldehyde
 Bisphenol A (4,4'-Isopropylidenediphenol) [80-05-7] (SP)
 Bisphenol A diglycidyl ether [1675-54-3] (Sh)
 Bisphenol A diglycidyl methacrylate [1565-94-2] (Sh)
 Bisphenol A ethoxylate dimethacrylate [24448-20-2] (Sh)
 Bisphenol A glycerolate [4687-94-9] (Sh)
 Bisphenol F diglycidyl ether (Sh)
 Bithionol [97-18-7] (SP)
 Bromelain [9001-00-7] (Sa)
 2-Bromo-2-nitro-1,3-propanediol [52-51-7] (Sh)
 use forbidden as component of metal-working fluids and corrosion inhibitors: see "GefStoffV 2010, Anhang II (zu §16 Absatz 2), Nr. 4"
 1,4-Butanediol diacrylate [1070-70-8] (Sh)
 1,4-Butanediol diglycidyl ether [2425-79-8] (Sh)
 1,4-Butanediol dimethacrylate [2082-81-7] (Sh)
 1-Butanethiol [109-79-5] (Sh)
 Butanone oxime [96-29-7] (Sh)
 n-Butvl acrylate [141-32-2] (Sh)
 tert-Butyl acrylate [1663-39-4] (Sh)
 2-Butyl-1,2-benzisothiazolin-3-one [4299-07-4] (Sh)
 p-tert-Butylcatechol [98-29-3; 27213-78-1] (Sh)
 n-Butyl glycidyl ether (BGE) [2426-08-6] (Sh)
 tert-Butyl glycidyl ether [7665-72-7] (Sh)
 n-Butyl methacrylate [97-88-1] (Sh)
 p-tert-Butylphenol [98-54-4] (Sh)
 p-tert-Butylphenyl glycidyl ether [3101-60-8] (Sh)
 Butynediol [110-65-6] (Sh)
 N-Carboxyanthranilic anhydride [118-48-9] (Sh)
 Cellulases (Sa)
 Cereal flour dusts Rye, Wheat (Sa)
 2-Chloroacetamide [79-07-2] (Sh)
 Chloroacetic acid methyl ester [96-34-4] (Sh)
 m-Chloroaniline [108-42-9] (Sh)
 p-Chloroaniline [106-47-8] (Sh)
 p-Chloro-m-cresol [59-50-7] (Sh)
 1-Chloro-2,4-dinitrobenzene [97-00-7] (Sh)
 1-Chloro-2,3-epoxypropane (Epichlorohydrin) [106-89-8] (Sh)
 5-Chloro-2-methyl-2,3-dihydroisothiazol-3-one and 2-methyl-2,3-dihydroisothiazol-3-one [26172-55-4; 2682-20-4] mixture
     in ratio 3:1 (Sh)
 Chlorothalonil [1897-45-6] (Sh)
 Chlorpromazine (2-chloro-10-(3-dimethylaminopropyl)phenothiazine) [50-53-3] (SP)
 Chromium(III) compounds (Sh)
 does not apply for chromium(III) oxide and similar poorly soluble chromium(III) compounds
 Chromium(VI) compounds (inhalable fraction) (Sh)
 barium chromate and lead chromate are not designated with "Sh"
 Cinnamaldehyde [104-55-2] (Sh)
 Cinnamyl alcohol [104-54-1] (Sh)
 Cobalt [7440-48-4] and cobalt compounds (inhalable fraction) (Sah)
```

Cresyl glycidyl ethers (Sh)

Cyanamide [420-04-2] (Sh)

Cyanuric chloride [108-77-0] (Sh)

N-Cyclohexyl-2-benzothiazolesulfenamide [95-33-0] (Sh)

N-Cyclohexyl-N'-phenyl-p-phenylendiamine [101-87-1] (Sh)

Diacetyl [431-03-8] (Sh)

4,4'-Diaminodiphenylmethane [101-77-9] (Sh)

1,5-Diaminonaphthalene [2243-62-1] (Sh)

2,2'-Dibenzothiazyl disulfide [120-78-5] (Sh)

2,2-Dibromo-2-cyanacetamide [10222-01-2] (Sh)

1,2-Dibromo-2,4-dicyanobutane [35691-65-7] (Sh)

3,4-Dichloroaniline [95-76-1] (Sh)

1,3-Dichloropropene (cis and trans) [542-75-6] (Sh)

Dicyclohexylcarbodiimide [538-75-0] (Sh)

Dicyclohexyl methane 4,4'-diisocyanate [5124-30-1] (Sh)

Diethanolamine [111-42-2] (Sh)

Reaction with nitrosating agents can result in the formation of carcinogenic N-nitrosodiethanolamine, see Section III "Amines which form carcinogenic nitrosamines on nitrosation".

Diethylene glycol diacrylate [4074-88-8] (Sh)

Diethylene glycol dimethacrylate [2358-84-1] (Sh)

Diethylenetriamine [111-40-0] (Sh)

Diglycidyl hexanediol [16096-31-4] (Sh)

Diglycidyl resorcinol ether [101-90-6] (Sh)

N,N'-(Dimethylamino)ethyl methacrylate [2867-47-2] (Sh)

N-(1,3-Dimethylbutyl)-N'-phenyl-p-phenylenediamine [793-24-8] (Sh)

1,1-Dimethylhydrazine [57-14-7] (Sh)

1,2-Dimethylhydrazine [540-73-8] (Sh)

Dimethylol dihydroxyethyleneurea [1854-26-8] (Sh)

1,3-Dimethylol-5,5-dimethyl hydantoin [6440-58-0] (Sh)

releases formaldehyde

Dipentamethylenethiuram disulfide [94-37-1] (Sh)

N,N-Diphenyl-p-phenylenediamine [74-31-7] (Sh)

Disperse blue 106/124 [68516-81-4; 15141-18-1] (Sh)

Disperse Orange 3 [730-40-5] (Sh)

Disperse Red 1 [2872-52-8] (Sh)

Disperse Red 17 [3179-89-3] (Sh)

Disperse Yellow 3 [2832-40-8] (Sh)

Disulfiram [97-77-8] (Sh)

Reaction with nitrosating agents can result in the formation of carcinogenic N-nitrosodiethylamine, see Section III "Amines which form carcinogenic nitrosamines on nitrosation".

2,2'-Dithiobis(N-methylbenzamide) [2527-58-4] (Sh)

3,4-Epoxycyclohexane carboxylic acid (3,4-epoxycyclohexylmethyl) ester [2386-87-0] (Sh)

1,2-Epoxypropane [75-56-9] (Sh)

Ethyl acrylate [140-88-5] (Sh)

5-Ethyl-3,7-dioxa-1-azabicyclo[3.3.0]octane (EDAO) [7747-35-5] (Sh)

releases formaldehyde

Ethylenediamine [107-15-3] (Sah)

Ethylene glycol dimethacrylate [97-90-5] (Sh)

2-Ethylhexyl mercaptoacetate [7659-86-1] (Sh)

Eugenol [97-53-0] (Sh)

Farnesol [4602-84-0] (Sh)

Formaldehyde [50-00-0] (Sh)

Formaldehyde condensation products with p-tert-butylphenol (low molecular) (Sh)

Formaldehyde condensation products with phenol (low-molecular) (Sh)

Geraniol [106-24-1] (Sh)

Glutaraldehyde [111-30-8] (Sah)

Glyceryl monothioglycolate [30618-84-9] (Sh)

Glycidyl methacrylate [106-91-2] (Sh)

Glycidyl trimethylammonium chloride [3033-77-0] (Sh)

Glyoxal [107-22-2] (Sh)

Gold [7440-57-5] and its inorganic compounds (Sh)

only soluble gold compounds

Hard metal containing tungsten carbide and cobalt (inhalable fraction) (Sah) Hexahydrophthalic acid diglycidylester [5493-45-8] (Sh) Hexahydrophthalic anhydride [85-42-7] (Sa)

1,6-Hexamethylene diisocyanate [822-06-0] (Sah)

Hexamethylenetetramine [100-97-0] (Sh)

releases formaldehyde

1,6-Hexanediol diacrylate [13048-33-4] (Sh)

Hydrazine [302-01-2] (Sh)

Hydrazine hydrate [7803-57-8] and hydrazine salts (Sh)

Hydroquinone [123-31-9] (Sh)

7-Hydroxycitronellal [107-75-5] (Sh)

2-Hydroxyethyl methacrylate [868-77-9] (Sh)

N-(2-Hydroxyethyl)piperidine [3040-44-6] (Sh)

Hydroxylamine [7803-49-8] and its salts (Sh)

4-(4-Hydroxy-4-methyl pentyl)-3-cyclohexene-1-carboxaldehyde (Lyral) [31906-04-4] (Sh)

3-Iodo-2-propynyl butylcarbamate [55406-53-6] (Sh)

Isobornyl acrylate [5888-33-5] (Sh)

Isoeugenol [97-54-1] (Sh)

Isophorone diisocyanate [4098-71-9] (Sah)

4-Isopropylphenyl isocyanate [31027-31-3] (Sh)

N-Isopropyl-N'-phenyl-p-phenylenediamine [101-72-4] (Sh)

D-Limonene [5989-27-5] (Sh)

D,L-Limonene [138-86-3] and similar mixtures (Sh)

L-Limonene [5989-54-8] (Sh)

Maleic anhydride [108-31-6] (Sah)

Manganese ethylenebis(dithiocarbamate) (Maneb) [12427-38-2] (Sh)

Merbromin [129-16-8] (Sh)

2-Mercaptobenzothiazole [149-30-4] (Sh)

Mercury [7439-97-6] and its inorganic compounds (as Hg) (Sh)

Mercury, organic compounds (Sh)

Methacrylic acid ethyl ester [97-63-2] (Sh)

Methacrylic acid 2-hydroxypropyl ester [923-26-2] (Sh)

Methacrylic acid methyl ester [80-62-6] (Sh)

Methenamine 3-chloroallylchloride [4080-31-3; 51229-78-8] (Sh)

releases formaldehyde

Methyl acrylate [96-33-3] (Sh)

N-Methyl-bis(2-chloroethyl)amine (nitrogen mustard) [51-75-2] (Sh)

N,N'-Methylenebis(5-methyloxazolidine) [66204-44-2] (Sh)

4,4'-Methylene diphenyl diisocyanate (MDI) [101-68-8] (inhalable fraction) see also "polymeric MDI" (Sah)

2-Methyl-4-isothiazolin-3-one [2682-20-4] (Sh)

N-Methylolchloroacetamide [2832-19-1] (Sh)

releases formaldehyde

2-Methyl-2-propanethiol [75-66-1] (Sh)

Methyltetrahydrophthalic anhydride [11070-44-3] (Sa)

N-Methyl-N,2,4,6-tetranitroaniline [479-45-8] (Sh)

Methyl vinyl ketone [78-94-4] (Sh)

Microbial rennets: endothiapepsin and mucorpepsin (Sa)

Monomethylhydrazine [60-34-4] (Sh)

 $\hbox{2-(4-Morpholinylmercapto)} benzothiazole~\hbox{[102-77-2] (Sh)}\\$ 

Naled [300-76-5] (Sh)

1,8-Naphthalic anhydride [81-84-5] (Sh)

1,5-Naphthylene diisocyanate [3173-72-6] (Sa)

Natural rubber latex [9006-04-6] (Sah)

Nickel and nickel compounds (inhalable fraction) (Sah)

Regarding compounds which have been found to be unequivocally carcinogenic in man, see documentation. There is sufficient evidence of sensitizing effects on the respiratory tract only for water-soluble nickel compounds.

4-Nitro-4'-aminodiphenylamine-2-sulfonic acid [91-29-2] (Sh)

4-(2-Nitrobutyl)morpholine (70% w/w) and 4,4'-(2-ethyl-2-nitro-1,3-propanediyl)bismorpholine (20% w/w) [2224-44-4; 1854-23-5] (mixture) (Sh)

In this mixture formaldehyde can be released and nitrosamines formed. Use forbidden as component of metal-working fluids and corrosion inhibitors: see "GefStoffV 2010, Anhang II (zu §16 Absatz 2), Nr. 4".

p-Nitrocumene [1817-47-6] (Sh)

2-Nitro-p-phenylenediamine [5307-14-2] (Sh)

Oakmoss extracts (Sh)

2-Octyl-4-isothiazolin-3-one [26530-20-1] (Sh)

Olaquindox (N-(2-hydroxyethyl)-3-methyl-2-quinoxalinecarboxamide 1,4-dioxide) [23696-28-8] (SP)

Palladium [7440-05-3] and palladium compounds

Palladium chloride [7647-10-1] (Sh)

bioavailable palladium(II) compounds (Sh)

Papain [9001-73-4] (Sa)

Pentaerythritol triacrylate [3524-68-3] (Sh)

2,3-Pentanedione [600-14-6] (Sh)

Pepsin [9001-75-6] (Sa)

o-Phenylenediamine [95-54-5] (Sh)

m-Phenylenediamine [108-45-2] (Sh)

p-Phenylenediamine [106-50-3] (Sh)

The "Ursol-Asthma" which used to be observed frequently, especially in persons dyeing furs with p-phenylenediamine, has not been demonstrated unequivocally to involve respiratory allergy to p-phenylenediamine; see documentation.

Phenyl glycidyl ether (PGE) [122-60-1] (Sh)

Phenylhydrazine [100-63-0] (Sh)

Phenyl isocyanate [103-71-9] (Sah)

N-Phenyl-1-naphthylamine [90-30-2] (Sh)

N-Phenyl-2-naphthylamine [135-88-6] (Sh)

Phthalic anhydride [85-44-9] (Sa)

Phytases (Sa)

Picric acid [88-89-1] (Sh)

Picryl chloride [88-88-0] (Sh)

Piperazine [110-85-0] (Sah)

Use in metal-working fluids is not permitted: see TRGS 611. Reaction with nitrosating agents can result in the formation of carcinogenic N,N'-dinitrosopiperazine, see Section III "Amines which form carcinogenic nitrosamines on nitrosation".

Platinum compounds (chloroplatinates) (Sah)

A peak concentration of  $2 \mu g/m^3$  should not be exceeded.

"polymeric MDI" [9016-87-9] (inhalable fraction) see also 4,4'-Methylene diphenyl diisocyanate (MDI) (Sah)

"polymeric MDI" (pMDI) is a technical grade MDI, containing 30–80% w/w 4,4′-methylene diphenyl isocyanate (MDI); the remainder consists of MDI oligomers and MDI homologues.

Pyrethrum [8003-34-7] (Sh)

does not apply for the constituents of insecticides (pyrethrins and cinerins) or for synthetic derivatives (pyrethroids) but only for the constituents of the plant drug and its crude extracts, including  $\alpha$ -methylene sesquiterpene lactones (e.g. pyrethrosin)

Quinone [106-51-4] (Sh)

Resorcinol [108-46-3] (Sh)

Ricinus protein (Sa)

Rosin (colophony) [8050-09-7] (Sh)

An immunological genesis of the asthma often seen in persons working with materials containing rosin has not been proved.

Rubber components

Dithiocarbamates (Sh)

Thiazoles (Sh)

p-Phenylenediamine compounds (Sh)

Thiurams (Sh)

Sesquiterpene lactones (Sh)

Sodium diethyldithiocarbamate [148-18-5] (Sh)

Use in metal-working fluids is not permitted: see TRGS 611. Reaction with nitrosating agents can result in the formation of carcinogenic N-nitrosodiethylamine, see Section III "Amines which form carcinogenic nitrosamines on nitrosation".

Soya bean constituents (Sa)

Subtilisins (Sa)

Tall oil, distilled [8002-26-4] (Sh)

only applies to tall oil distillates containing abietic acid, see also documentation

Tetraethylene glycol diacrylate [17831-71-9] (Sh)

Tetraethylene glycol dimethacrylate [109-17-1] (Sh)

Tetraglycidyl-4,4'-methylenedianiline [28768-32-3] (Sh)

Tetrahydrofurfuryl methacrylate [2455-24-5] (Sh)

Tetramethylol acetylenediurea [5395-50-6] (Sh)

releases formaldehyde

Thimerosal [54-64-8] (Sh)

Thioglycolates (Sh)

Thioglycolic acid [68-11-1] (Sh)

Thiram [137-26-8] (Sh)

Reaction with nitrosating agents can result in the formation of carcinogenic N-nitrosodimethylamine, see Section III "Amines which form carcinogenic nitrosamines on nitrosation".

2,4-Toluenediamine [95-80-7] (Sh)

2,5-Toluenediamine [95-70-5] (Sh)

Toluene diisocyanates (Sah)

p-Toluidine [106-49-0] (Sh)

1,2,3-Trichlorobenzene [87-61-6] (Sh)

Triethylene glycol diacrylate [1680-21-3] (Sh)

Triethylene glycol dimethacrylate [109-16-0] (Sh)

Triethylenetetramine [112-24-3] (Sh)

Triglycidyl-p-aminophenol [5026-74-4] (Sh)

1,3,5-Triglycidyl isocyanurate (mixture of isomers) [2451-62-9] (Sah)

Triisobutyl phosphate [126-71-6] (Sh)

Trimellitic anhydride [552-30-7] (Sa)

Trimethylhydroquinone [700-13-0] (Sh)

Trimethylolpropane triacrylate [15625-89-5] (Sh)

Trimethylquinone [935-92-2] (Sh)

2,4,6-Trinitrotoluene [118-96-7] (Sh)

Triphenylphosphine [603-35-0] (Sh)

Tripropylene glycol diacrylate [42978-66-5] (Sh)

N,N',N''-Tris(β-hydroxyethyl)hexahydro-1,3,5-triazine [4719-04-4] (Sh)

releases formaldehyde

 $N,N',N''-Tris(\beta-hydroxypropyl)hexahydro-1,3,5-triazine~[25254-50-6]~(Sh)$ 

releases formaldehyde

Trypsin and Chymotrypsin [9002-07-7; 9004-07-3] (Sa)

Turpentine [8006-64-2] (Sh)

Vinylcarbazole [1484-13-5] (Sh)

Woods

Acacia melanoxylon R.Br., Australian blackwood (Sh)

Brya ebenus DC., cocus wood (Sh)

Chlorophora excelsa (Welw.) Benth. & Hook, iroko, kambala (Sh)

Dalbergia latifolia Roxb., East Indian rosewood, Bombay blackwood (Sh)

Dalbergia melanoxylon Guill. et Perr., African blackwood (Sh)

Dalbergia nigra Allem., Brazilian rosewood (Sh)

## e) Evaluation of members of specific groups of substances

For numerous substances, a reliable evaluation of the sensitizing effects according to the criteria described above is not possible. Often the substance of interest is one of the many members of a specific group of substances. Valid data for man are generally available only for individual members of such groups of substances, those considered to be typical of the group and commercially available as test substances because they are used for this purpose. With other less frequently used substances or substances for which no reliable data as to the extent of their use is available, patch tests are carried out relatively rarely, with some substances – because of the danger of sensitization – only in special cases. The effects in man are made even more difficult to assess because these substances are often used in mixtures with other members of the same group of substances and so can be involved in concomitant sensitizations and in cross-reactions. Mixtures containing members of other groups of allergenic substances are also often used and then too it is not readily possible to determine the causality of the observed disorder. In addition, it is not always possible to establish all the components of the mixture involved and so an allergologically relevant component can be missed. Therefore, substances which are not listed in the List of MAK and BAT Values and which belong to groups of substances known to be able to cause sensitization should be handled with appropriate care.

It is emphasized that in general there is no danger of sensitization from fully polymerized plastics. A danger of sensitization, but only little, can result from release of residual monomer, e. g. during mechanical processing.

The groups of substances of which numerous members have sensitizing effects on the skin or airways include:

- acrylates and methacrylates
- dicarboxylic acid anhydrides
- diisocyanates
- glycidyl compounds (epoxides)
- · dusts containing enzymes
- · certain plant or animal proteins

In current usage, the general expression "isocyanate" is used for both monoisocyanates and di- or polyisocyanates. These classes of compounds must be strictly differentiated with regard to the areas of use as well as the toxicological and allergological properties: monoisocyanates such as methyl isocyanate or phenyl isocyanate are used practically almost exclusively during syntheses as precursors or intermediate products, for example in the production of insecticides or pesticides. On the other hand, diisocyanates in particular are used in the production of polyurethanes, which are processed to adhesives, insulating foams, lacquers, and foams. Findings of a sensitizing effect on the respiratory tract in humans are available almost only for diisocyanates because of the widespread use. Also monoisocyanates can have a marked irritating effect on the airways and a sensitizing effect on the respiratory tract cannot be excluded. However, data for the diisocyanates, which are assessed as potent respiratory allergens, does not justify classifying monoisocyanates as substances causing airway sensitization solely in analogy; an evaluation of the individual case is necessary.

The antibiotics are a group of substances which are very heterogeneous in chemical structure and in sensitizing effects. Persons may be exposed to these substances at work during isolation or production of the active principles, during preparation and packing of the medicines, and during their medical use in man and animals. Sensitization of the skin can result in the development of a systemic allergic reaction – including anaphylaxis – or haematogenic contact dermatitis after later parenteral use. Sensitization of the airways and allergic contact dermatitis have often been reported in persons exposed occupationally to β-lactam antibiotics (especially penicillins and cephalosporins). Allergic reactions after medicinal use of these antibiotics (enteral or parenteral), on the other hand, generally take the form of IgE-mediated reactions of immediate type. However, other immunological reactions such as medicinal skin eruptions and, in serious cases, also erythema exsudativum multiforme, Stevens-Johnson syndrome or Lyell's syndrome can also develop. Some of the aminoglycoside antibiotics are also conspicuous for the relatively high rates of sensitization which they produce, especially as a result of application of medicaments to (chronically) eroded skin. Sensitization of the skin resulting from occupational contact with aminoglycosides has been reported more rarely. Individual macrolide antibiotics, especially those used in veterinary medicine, can cause immunological reactions in the airways and also (inhalation-mediated) contact dermatitis. Only rare individual cases of contact allergy or allergic airway reactions to most other macrolide antibiotics and to polyene or peptide antibiotics and tetracyclines have been reported.

Components of fragrance mixtures, another group of substances which differ widely in their structures, allergenic potencies and clinical significance, must also be evaluated individually. This becomes clear even on consideration of the components of the standard fragrance test mixtures. For many other fragrance components the clinical findings are inadequate because the substances are never or only very rarely used in patch tests. Non-occupational exposure to these practically ubiquitous fragrance mixtures can rarely be excluded and this makes the demonstration that sensitization was occupational more difficult.

#### V. Aerosols

### a) General definitions

**Aerosols** are multiphase systems of particulate solids or liquids dispersed in gases, in particular in air. Aerosols which occur at the workplace include dusts, fumes and mists.

**Dusts** consist of particles of solid matter which have been produced mostly in mechanical processes or have been stirred up and dispersed in gases, in particular in air.

Airborne particles can be composed of compact fine particles and free ultrafine primary particles but can also consist of their aggregates or agglomerates. The following nomenclature will be used:

- Primary particles are compact single particles which are recognizable as such under the electron microscope, even when they are associated with other aggregates or agglomerates.
- Aggregates<sup>37</sup>)<sup>38</sup>) are groups of primary particles which are firmly bound with each other.
- Agglomerates<sup>37</sup>)<sup>38</sup>) are groups of particles (primary particles or aggregates), which are held together by weak forces (in particular van der Waals forces). They can be broken apart again into smaller units by input of a low level of energy (e. g. by treatment of an aqueous suspension with ultrasound).

**Fibrous dusts** consist of inorganic or organic fibres of certain dimensions dispersed in gases, in particular in air (see Section III "Carcinogenic substances, Fibrous dust"). Inorganic fibrous dusts arise during mechanical processing especially of fibrous minerals and of products made from or containing natural or man-made fibres. Fibre-shaped fragments of non-fibrous minerals and of non-fibrous products also count as fibrous dust. Fibres can also be released by erosion processes.

**Fumes** are dispersions of very finely divided solid matter in gases, in particular in air. They arise in thermal processes (e. g., welding fumes, metal oxide fumes, soot and flue ash) or chemical processes (e. g., the reaction of ammonia with hydrogen chloride).

**Mists** are dispersions of particulate liquids (droplets) in gases, in particular in air. They arise during nebulization of liquids, during condensation from the vapour phase and during chemical processes (e. g., oil mist, hydrogen chloride in damp air).

Ultrafine particles and their aggregates and agglomerates see Section Vh.

**Ultrafine particles** as components of dusts and fumes are identified by a mobility-equivalent diameter  $(D_M) < 100$  nm (corresponds to a diffusion-equivalent diameter  $(D_{ae}) < 100$  nm) (see Section Vh and documentation "Aerosols – Dusts, Fumes and Mists" 1999<sup>39</sup>)).

The **respirable dust fraction (R)** and the **inhalable fraction (I)** of the dust are the aerosol fractions relevant for health (according to DIN/EN 481) for which limit values apply (see Section Vd).

## b) Properties of aerosols which determine their effects

Particulate substances encountered at the workplace can cause various disorders of the respiratory organs. These are mostly a result of overloading of the lung, or of carcinogenic, fibrotic (fibrogenic) or allergenic effects, or of chemical irritation or toxicity. The effects are determined in part by the site of deposition of inhaled particles or droplets in the respiratory tract. The deposition pattern of the particles or droplets and the intensity and rapidity of appearance of the effects are determined essentially by the size, mass, specific density, shape, surface area, chemical composition, biopersistence, solubility, and hygroscopic properties of the particles.

These parameters can act independently of one another as well as in combination. The effects of coarser particles are largely proportional to the mass or the volume.

<sup>37)</sup> The terms "aggregates" and "agglomerates" are not used uniformly on the international level. See, for example, the definitions of ISO 14887, NIST, BSI, IUPAC, etc.

<sup>38)</sup> When measuring the shape and size of airborne particles in aerosols, it is not possible to differentiate between compact particles and aggregates and agglomerates of the same size. It is also not possible to differentiate between liquid droplets and solid particles. As it is not possible to differentiate between aggregates and agglomerates in air measurements, even with an electron microscope, the groups of ultrafine primary particles observed are often summarised in practice as "aggregates and agglomerates (A+A)".

<sup>39)</sup> Greim H, editor (1999) Aerosols – Dusts, Fumes and Mists. MAK Value Documentation, 1997. In: Occupational Toxicants. Volume 12. Weinheim: Wiley-VCH. p. 271–292. Also available from <a href="https://doi.org/10.1002/3527600418.mb0aeroaere0012">https://doi.org/10.1002/3527600418.mb0aeroaere0012</a>

With all **aerosols of ultrafine particles** as compared with coarser particles, an important role is played by the large specific surface area, the low density of the agglomerate compared with the material density of ultrafine particles, the slight solubility and the uptake into the cells. These properties of ultrafine particles can result in other toxicologically relevant effects. When aggregates or agglomerates of ultrafine particles are deposited, their effects also depend on whether they disaggregate or not in the fluid environment of the lung.

In the milieu of the lung fluids, particulate substances have as a rule a bioavailability other than indicated by the physicochemical solubilities reported in the literature, which are mostly determined in water, or where appropriate also in other solvents. Thus, the poor solubility suggested by the reported data for a substance is not directly applicable to the lung tissue. With the diversity of particles deposited in the lung fluids, also changes in toxicity can occur in individual cases through masking and demasking, e. g., in the presence of particles with adsorbing surfaces.

In lung fluids, not only the dissolution of particles (such as metal particles) and the absorption of dissolved substances are observed, but also changes in the crystalline structure. For example, certain glass fibres become jelly-like (that is, they lose their rigidity and become rubberlike), or chrysotile fibres are split into their individual fibrils, which in this case causes an increase in the number of particularly fine fibres. Such processes of splitting have now been identified for other fibrous substances. The properties of ultrafine fibres (such as nanotubes) have not yet been adequately investigated.

## c) Inhalation, deposition and clearance of aerosols in the respiratory tract

### Uptake

The uptake of dusts and fumes into the body takes place mostly via the airways. Mists can also be taken up in relevant amounts through the skin.

Transport and deposition of particulate solids and droplets in the airways are determined by the size, shape and specific density of the particles or droplets.

The distribution of the inhaled aerosol within the various parts of the airways is affected not only by the properties of the particles but also markedly by:

- 1. individual differences in the anatomy of the airways,
- 2. individual breathing habits, especially the different transition from nasal to oral breathing during physical activity and differences in respiration rate, respiratory flow and thus respiratory volumes,
- 3. pathophysiological changes in the respiratory organs (e. g. obstructive airway disease).

The critical dimension for aerosol particles with a diameter  $> 0.5~\mu m$  is the **aerodynamic diameter** ( $D_{ae}$ ). The aerodynamic diameter of a particle whatever its shape and density is defined as the geometric diameter of a sphere with the density 1 g/cm<sup>3</sup> which sediments at the same rate as the particle in still or laminarly flowing air. This definition also applies for fibrous particles. The aerodynamic diameter of a fibre is determined essentially by the diameter of the fibre and less by its length. For long fibres (l >> d) the aerodynamic diameter is about three times the fibre diameter.

For isometric particles with diameters less than 0.5  $\mu$ m, the **diffusion-equivalent diameter** ( $D_d$ ) determines the site of deposition in the airways. The diffusion-equivalent diameter of a particle is defined as the geometric diameter of a sphere which diffuses at the same rate as the particle in the same dispersion medium (at the work-place, in air).

On principle, it is necessary to distinguish between the aerosol fractions which enter the various regions of the airways during inhalation and exhalation and the parts of these fractions which are deposited in these airway regions.

Deposition can take place during inhalation or during exhalation. Some of the inhaled particles are not deposited in the airways but are exhaled.

Of particular importance for occupational health are the aerosol fractions which penetrate into the respirator organs and are deposited there; they are described below (Figure 1).

Only a fraction of the total particles present in the breathing zone (the part designated as the **inhaled fraction**) is inhaled. It is determined by the flow rates into the mouth and nose as well as the conditions of air flow around the head. Whereas almost all the smaller particles ( $D_{ae}$  < 5  $\mu$ m) are inhaled, the fraction of particles which can be inhaled decreases with increasing particle size.

Of the particles in the inhaled fraction, larger solid particles and droplets ( $D_{ae} > 15 \mu m$ ) are deposited almost exclusively in the extrathoracic region, i. e., in the region of the nose, pharynx and larynx.

Of the **fraction which enters the thorax (thoracic fraction)** some of the smaller solid particles and droplets are deposited in the tracheobronchial region or in the alveolar region.

Figure 1. Subdivision of the aerosol in the breathing zone according to occupational medical criteria and deposition behaviour of the fractions.

The transfer of the inhaled fraction of the aerosol in the breathing zone into the thorax and the alveolar region, i.e., the alveoli, the non-ciliated bronchioles and the alveolar ducts, is represented by arrows. The arrows pointing to the right show the fractions deposited in the three regions of the respiratory tract, those pointing to the left show the contribution from these regions to the exhaled fraction.

The **fraction which enters the alveolar region (respirable fraction)** contains those particles which can penetrate into the airway regions which are not ciliated, i. e., the alveoli, the terminal non-ciliated bronchioles and the alveolar ducts; some of this fraction is deposited there.

### **Deposition and Clearance**

## Fraction deposited in the nose-pharynx-larynx region (extrathoracic fraction)

This is the aerosol fraction which is deposited after inhalation in the region of the nose, the mouth, the throat and the larynx; part of this fraction can be swallowed and so enter the digestive tract. The clearance from this region of the respiratory tract is complete within a few hours at most (Figure 2).

## Fraction deposited in the tracheobronchial region

This is that part of the fraction which enters the thorax which is deposited in the region of the tracheobronchial tree in which the mucociliary clearance mechanism operates.

Isometric particles with diameters > 7  $\mu$ m are completely eliminated from the tracheobronchial region of a healthy person within one day. There is evidence that some of the smaller particles and especially ultrafine particles may persist for several weeks in the tracheobronchial region. The rate of transport out of this region decreases with decreasing particle size.

### Fraction deposited in the alveolar region

This is the fraction of the aerosol which is deposited in the alveolar region including the non-ciliated bronchioles (bronchioli respiratorii) and the alveolar ducts (ductuli alveolares). In this region there is no mucociliary clearance. This aerosol fraction can be transferred via the pulmonary interstitial tissue (interstitium) into the lymphatic system and especially ultrafine particles can also enter the blood capillaries. Alveolar macrophages can take in particles by phagocytosis and transport these through the tracheobronchial tree; swallowing then transfers them into the

Figure 2. Diagram showing the fractions of the aerosol in the respiratory organs which are relevant for occupational health. Alongside the curves for the fractions deposited in the various regions, the fractions exhaled from those regions are shown as shaded areas. The two fractions in solid boxes are those corresponding to the conventions for measuring particle concentrations for checking the observance of MAK values.

digestive tract. The half-times for the elimination from the lung of insoluble particles deposited in the alveolar region are of the order of months or years.

## Total deposited fraction

The total deposited fraction is that aerosol fraction which is inhaled but then not exhaled. This fraction includes the particles and droplets deposited in the nose, pharynx and larynx, the tracheobronchial tree and the non-ciliated deeper airways, and thus the entire range of the inhalable dust fraction.

It should be remembered that deposited droplets and soluble particles spread on the surfaces of the respiratory organs and lose their droplet or particulate form. Soluble components can be absorbed, which means that the constituents of the dissolved particles may be distributed and their cellular effects may no longer be only localized. They can enter the circulation and the lymphatic system and have systemic effects.

The insoluble fraction can be phagocytised by macrophages or, with certain limitations, be taken in by lung epithelial cells and transported from the alveolar region into the interstitial tissue. Especially ultrafine particles can enter the bloodstream by this route. Components which are neither dissolved nor absorbed can be transported from the tracheobronchial tree towards the larynx by mucociliary clearance, as can particles deposited in the nose-pharynx-larynx region. From there, they are swallowed, enter the digestive system and perhaps have effects there, or they are removed from the breathing zone or the body by coughing up and spitting out or by blowing of the nose.

# d) Conventions for measuring concentrations of particles: definition of fractions

Measured particle concentrations should reflect the concentrations of those particles responsible for the pathogenic effects in the respiratory organs, as described in Section c. This requires that in sampling and assay devices the particles from the air are fractionated according to their aerodynamic diameters in a way which reflects the deposition pattern of the particles in the airways during breathing.

However, for measuring and sampling devices for the determination of various particle fractions in the workplace air, international conventions have been established for only three deposition curves (see DIN/EN 481, 1993)<sup>40</sup>). They are based on average analytical values obtained under defined experimental conditions for the aerosol fractions which enter the various regions of the respiratory organs.

Thus the analytical methods yield data for the three fractions which may be deposited, in each case including the fraction which is exhaled. That means that the aerosol fractions determined are those which enter the regions of the lung which are relevant for occupational health (see Figures 1 and 2).

- 1. **Inhalable fraction (I):** the deposition curve expresses, as a function of aerodynamic diameter, the mean probability that particles and droplets will be inhaled (inhaled fraction).
- 2. **Thoracic fraction:** the curve for this part of the inhalable fraction expresses, as a function of aerodynamic diameter, the mean probability that particles and droplets will enter the tracheobronchial tree and the alveolar region (fraction which enters the thorax).
- 3. **Respirable fraction (R):** the curve for this part of the thoracic fraction expresses, as a function of aerodynamic diameter, the mean probability that particles and droplets will enter the alveolar region (fraction which enters the alveolar region).
- 4. **Extrathoracic fraction:** this fraction is obtained by subtracting the thoracic fraction from the inhalable fraction.
- 5. **Tracheobronchial fraction:** this fraction is obtained by subtracting the alveolar fraction from the thoracic fraction.

The use of this analytical procedure for hygroscopic particles is justified by the fact that their aerodynamic diameters increase during transport into the respiratory organs as a result of uptake of water and that therefore the sites of deposition and proportion of particles deposited cannot be predicted.

The definitions of the "inhalable fraction" (I)<sup>41</sup>) and "respirable fraction" (R)<sup>42</sup>) correspond to the definitions of "total dust" (G) and "fine dust" (G) used until 1996 in the establishment of MAK values<sup>43</sup>). Since 1996 the internationally accepted definitions have been used.

## e) Fibrogenic aerosols

As fibrogenic dusts are designated aerosols, including droplet aerosols, which contain insoluble particles which can cause dust lung diseases (e. g. silicosis) involving formation of connective tissue. Prerequisite for the development of such disorders is the deposition of the aerosol in the alveolar region. Therefore, the effective levels of fibrogenic aerosols are determined after sampling the respirable fraction (R) (previously "fine dust", (F)).

### f) General limit value for dust

The "general limit value for dust" is established as a concentration of the respirable fraction (R) of biopersistent granular dusts<sup>44</sup>) of 0.3 mg/m<sup>3 45</sup>) for dusts with a density of 1 g/cm<sup>3</sup> and a concentration of the inhalable fraction (I) of  $4 \text{ mg/m}^3$ .

Excursions above the limit value as described in Section Vg are permitted for the inhalable fraction. The permitted excursions may not exceed the "general limit value for dust" by a factor of more than two (see documentation "Aerosols – Dusts, Fumes and Mists" 1999<sup>46</sup>)).

Observance of the general limit value for dust should prevent unspecific effects of dust (e. g. overloading effects) on the respiratory organs. The general limit value applies for poorly soluble and insoluble dusts which are not subject to other regulations and for mixtures of dusts even when for individual components of a dust specific MAK

<sup>45)</sup> for dusts with a density of 1 g/cm<sup>3</sup>

<sup>&</sup>lt;sup>46</sup>) Greim H, editor (1999) Aerosols – Dusts, Fumes and Mists. MAK Value Documentation, 1997. In: Occupational Toxicants. Volume 12. Weinheim: Wiley-VCH. p. 271–292. Also available from <a href="https://doi.org/10.1002/3527600418.mb0aeroaere0012">https://doi.org/10.1002/3527600418.mb0aeroaere0012</a>

values exist and are observed. The general limit value does not apply for soluble particles, especially not for salts from rock salt and potash deposits, or for ultrafine (see Section Vh) or dispersed coarse particle fractions.

Even when the general limit value for dust is observed, a health hazard may be ruled out only if it has been demonstrated that other substance-specific effects of the dust are not to be expected.

## g) Exposures exceeding the MAK value

MAK values for aerosols which are designated with a reference to Section Vg have been derived from average long-term exposure levels without detectable effects (no observed adverse effect levels, NOAEL).

Impairment of respiratory organ function by these dusts is a result of long-term effects which are determined largely by the aerosol concentration to which the person is exposed over long periods of time. The MAK values correspond to the average long-term exposure levels without detectable effects (NOAEL) but apply to the concentration values averaged over a single shift. As the long-term exposure level is an average of variously high shift average levels, the occasional exceeding of the MAK value by single shift average levels can be tolerated. The permitted frequency and extent of the excursions above the MAK value are established on the basis of occupational medical and toxicological findings (see documentation "Derivation of MAK values for dusts from long-term threshold values" 1998<sup>47</sup>)). In these cases the peak limitation categories do not apply.

For all other aerosols the peak limitation categories must be observed (see Section VI "Limitation of exposure peaks").

## h) Ultrafine particles, their aggregates and agglomerates

Ultrafine primary particles are measured according to their mobility-equivalent diameter ( $D_M$ ) < 100 nm (corresponds to a diffusion-equivalent diameter ( $D_{ae}$ ) < 100 nm). They can occur as single particles in the workplace air or more often as basic units of aggregates and agglomerates. In these forms they can be seen under an electron microscope.

For the characterization of the potential danger associated with **ultrafine primary particles** and their aggregates and agglomerates, the following aspects are of significance.

- The particles are formed mostly in combustion processes and gas phase reactions.
- The mechanisms of deposition in the respiratory tract involve the Brownian motion of the particles.
- The effects of the particles in the respiratory tract increase not so much in proportion to the weight as in proportion to the surface area or number of particles per air volume.
- The probability of aggregate or agglomerate formation depends also on the concentration of primary particles in the workplace air.

#### Notes:

Depending on the definition of the limit value, for **dusts** and **fumes** either the inhalable fraction "I" or the respirable fraction "R" is determined. For **mists**, the inhalable fraction "I" is determined.

Sampling devices which sample fine dust according to the Johannesburg convention, which used to be used in Germany, fulfil the requirements of DIN/EN 481 for the sampling of respirable dust.

When sampling devices are used which collect fractions for assay according to deposition functions which differ from those described above, the results must be corrected using a correction factor which is dependent on the particle size distribution. The validity of the procedure must be documented.

It must be emphasized that the total dust fraction (G) which used to be determined in Germany and also the inhalable dust fraction (I) used today may not be automatically assumed to be equivalent to "total dust", a term which is still widely found in the international literature. The term "total dust" does not describe a standardized dimension. Sampling devices which collect "total dust" must be validated.

The fractions  $PM_{10}$  and  $PM_{2.5}$  collected during sampling of environmental air outdoors are defined by ISO 7708.  $PM_{10}$  corresponds to the thoracic fraction (function with 50 % deposition at 10  $\mu$ m) whereas  $PM_{2.5}$  is described by a curve with 50 % deposition at 2.5  $\mu$ m. The respirable dust fraction (R) would therefore correspond to  $PM_4$ .

For the determination of **fibrous dusts**, fractions are not defined according to aerodynamic criteria. Instead the fibre lengths and diameters must be determined microscopically (see Section III "Carcinogenic substances, Fibrous dusts").

<sup>47)</sup> Greim H, editor (1998) Derivation of MAK values for dusts from long-term threshold values. MAK Value Documentation, 1996. In: Occupational Toxicants. Volume 11. Weinheim: Wiley-VCH. p. 281–301. Also available from <a href="https://doi.org/10.1002/3527600418.mb0lsppere0011">https://doi.org/10.1002/3527600418.mb0lsppere0011</a>

## VI. Limitation of exposure peaks

MAK values are conceived and applied as 8-hour time-weighted average values. The actual concentrations of substances in the workplace air are, however, frequently subject to considerable variation. Excursions above the average value must be limited in order to prevent local irritation, unreasonable annoyance and adverse systemic effects. For reasons of analytical practicability, peak values for the substances have been established for a 15-minute average. For a discussion of the use of longer sampling periods see documentation "Peak limitation" 2017<sup>48</sup>).

The effects on health of exceeding the MAK value for brief periods depend decisively on the mode of action of the substance in question. Since the year 2000, substances have been assessed individually and substance-specific excursion factors (ratio of permitted short-term peak value to the MAK value) have been established. For substances in Category I, the MAK value in the 15-minute average may generally not be exceeded (excursion factor = 1 is the default value) unless the available data permit the establishment of a different excursion factor. For some substances excursion factors > 1 have been derived. For substances in Category II, the default value is 2. For this group of substances, in appropriate cases, excursion factors deviating from the base value have been established. The permitted frequency per shift of excursions above the MAK value, the minimum period between individual exposure peaks, and the total permitted duration of excursions above the MAK value are to be seen as a convention<sup>49</sup>).

This concept takes into account both the toxicological situation and the analytical practicability.

Thus, the two categories shown in the table below have been established for the limitation of peak concentrations at the workplace; see also documentation "Peak limitation" 2017, 2024<sup>48</sup>).

Excursion factors, duration, number per shift and interval between the peaks

	Category	Excursion factor	Duration	Number per shift	Minimum interval <sup>c)</sup>
I	Substances with immediate effects (irritants) or which cause sensitization of the airways	1 <sup>a)</sup>	15 min, average value <sup>b)</sup>	4	1 h
II	Substances with delayed effects (systemic effects or effects in the lungs after repeated exposure)	2 <sup>a)</sup>	15 min, average value	4	1 h

 $<sup>^{\</sup>mathrm{a})}$  default value, or a substance-specific value (maximum 8)

In Section IIa of the List of MAK and BAT Values, the Peak limitation category for each substance is listed and in brackets also the appropriate excursion factor. Carcinogenic substances without a MAK value have no entry (–).

A description of analytical methods for monitoring workplaces and documentations for the individual substances has been published in "The MAK Collection for Occupational Health and Safety" <sup>50</sup>).

b) In certain cases, a momentary value (concentration which should not be exceeded at any time) can also be established.

 $<sup>^{\</sup>rm c)}$  only for excursion factors > 1

## VII. Percutaneous absorption

At the workplace the absorption of substances through the skin can make a significant contribution to the systemic exposure of the employee or can even be the main exposure route.

The only relevant barrier to absorption of substances at work is the horny layer (stratum corneum) of the skin. The ability of a substance to penetrate this barrier is determined by its physicochemical properties. The rate of dermal penetration is also affected by workplace conditions and by individual factors. Solid, liquid and gaseous substances can be taken up percutaneously. For many substances the skin acts as a depot from which absorption continues even after the end of exposure. Normal working clothes do not generally provide any protection against percutaneous absorption. Quantification of the amount of a substance absorbed through the skin can only be realized by biological monitoring (see Section XI).

Substances are designated with an "H" if through dermal exposure the observance of the MAK value on its own no longer guarantees the prevention of important adverse effects on health which were considered for establishment of the limit value. In addition to systemic effects these can also include the sensitization of the respiratory tract if it has been demonstrated to be induced by skin contact. Substances are not designated with an "H" if toxic effects are not to be expected under workplace conditions, independent of the ability of the substance to penetrate the skin. It may not be assumed that the absence of a designation with "H" means that wearing inhalation protection is sufficient to adequately protect an employee from the substance if the MAK value can not be observed. Under these conditions, considerable absorption from the gas phase was detected, especially for amphiphilic substances. Substances in section IIb are dealt with in analogy to substances with MAK values and designated with "H" when a toxicologically relevant uptake can be assumed and one of the criteria for designation is fulfilled. Carcinogenic substances in Categories 1 and 2 and suspected carcinogens without a MAK value in Category 3 are designated with an "H" whenever it appears that dermal absorption can make a significant contribution to a person's body burden. For an assessment of the measures necessary for adequate occupational hygiene, the reader is referred to the documentation for the substance in question.

A substance is designated with an "H" when one of the criteria listed below is fulfilled:

### 1. Designation with "H" on the basis of workplace studies

Field studies or scientifically documented casuistics demonstrate that percutaneous absorption is significant in practice in persons handling the substance:

The percutaneous absorption is certainly responsible for part of the systemic dose and can contribute to toxic effects.

#### 2. Designation with "H" on the basis of animal studies

Percutaneous absorption can be demonstrated in animal studies and the exposure can contribute to toxic effects.

## 3. Designation with "H" on the basis of in vitro studies

A relevant level of percutaneous absorption which can contribute to toxic effects has been quantified with recognized methods. The flux through the skin has been determined and the permeability constant has been or may be calculated, or details of percentage absorption of the applied dose (percentage absorbed per unit of time and skin surface area) are available.

#### 4. Designation with "H" on the basis of theoretical models

On the basis of data for analogous substances or calculations with mathematical models, a relevant level of percutaneous absorption may be expected.

The criteria 1 to 4 are arranged in order of decreasing significance; data obtained with exposed persons are most important. The quantitative criteria are described in detail in "Criteria for designation with an H"<sup>51</sup>).

The designation "H" is shown in the List of MAK and BAT Values and does not indicate that the substance can cause skin irritation.

<sup>51)</sup> Hartwig A, MAK Commission (2017) Criteria for designation with an "H". MAK Value Documentation, 2014. MAK Collect Occup Health Saf 2(3): 1112–1118. https://doi.org/10.1002/3527600418.mb0hmrkkrie5617

## VIII. MAK values and pregnancy

Observance of the MAK values and BAT values does not guarantee, in every case, that the unborn child is reliably protected because numerous substances have not yet been investigated or have been only partially tested for prenatal toxicity.

### **Definition**

The expression "prenatal toxicity" or developmental toxicity is taken in its broadest sense by the Commission; it includes any effect of the substance which elicits an alteration from the physiological norm in the development of the organism and leads to prenatal or postnatal death of the offspring or to permanent morphological or functional damage.

### Effects in humans

Epidemiological studies that yield evidence of toxic effects of substances on the human embryo or foetus are of particular importance for the assessment. Limitations of such studies such as methodological weaknesses, low statistical power, mixed exposure, personal influencing factors and lifestyle make it difficult to draw clear conclusions about substance-specific effects and effect thresholds.

#### **Animal Studies**

The evaluation of the developmental toxicity of substances is based mainly on animal studies. Studies which have been carried out according to internationally recognized testing guidelines such as OECD or similar test guidelines (e. g. EU, Japan) play a decisive role. The OECD Test Guideline 414 in particular is appropriate for the determination of prenatal toxicity. Testing for perinatal and postnatal toxicity, to a limited extent also for prenatal toxicity, is carried out in one-generation studies according to OECD Test Guideline 415 (valid until 27 December 2019), in extended one-generation studies according to OECD Test Guideline 443, in two-generation studies according to OECD Test Guideline 416 or in screening tests according to OECD Test Guidelines 421 and 422. If studies are available that were not conducted according to these guidelines, their validity is to be determined individually. The most important criteria are a sufficiently large number of animals, the use of different dose groups with derivation of a NOAEL (no observed adverse effect level), in-depth studies (external, skeletal and visceral examinations of the foetuses in the developmental toxicity studies) and adequate documentation of the results.

Inhalation studies are of particular importance in assessment of the prenatal toxicity of substances present at the workplace. Also studies with oral administration or dermal application can be taken into consideration if the available data do not present evidence against extrapolation to inhalative administration (e. g. by a pronounced "first pass" effect). Studies carried out with routes of administration which are not relevant in humans (e. g. intraperitoneal) are not included in the evaluation as a rule.

In studies with an oral route of administration, higher doses than those with inhalative or dermal application are usually possible. For this reason, effects are also reported which occur only in the high dose range. Therefore, the test guidelines mentioned consider 1000 mg/kg body weight to be the maximum dose to be tested (limit dose). Such high dose effects are mostly irrelevant for assessing prenatal toxicity at concentrations near the MAK value. Prenatal toxic effects which are observed in the presence of marked maternal toxicity are of low relevance for the situation at the workplace as they are prevented by observance of the MAK value. Findings at doses or concentrations at which no or only slight maternal toxicity is observed are of particular relevance.

The preferred animal species usually recommended in the test guidelines for prenatal developmental toxicity (OECD 414) are female rats and rabbits. The generation studies (e. g. OECD 415, 416 and 443) including the screening tests (e. g. OECD 421 and 422) are usually carried out only with rats of both sexes.

In order to take into consideration the different stage of maturity of organs at birth in rodents compared with in humans (e. g. brain and kidneys), in studies with rodents the evaluation of developmental toxicity may include exposure extending into the postnatal period.

To consider the factor of uncertainty in assessing animal studies, the margin between the NOAEL for developmental toxicity in animal studies and the resulting exposure level or body burden if the MAK or BAT value is observed must be adequate. The necessary margin depends on a number of very different factors:

- comparative toxicokinetic data for humans and animals
- toxicokinetic data for a substance in the dams and embryos or foetuses to evaluate differences in level of exposure between maternal and foetal organs/tissues

- If such data are not available, the evaluation of specific substance properties such as molecular size, lipid solubility and protein binding plays an important role; such data determine the transplacental transfer of the substance from the mother animal and the internal exposure of the embryos or foetuses.
- The kind and severity of the results observed are important factors. Serious effects such as the increased occurrence of specific malformations at doses not causing simultaneous maternal toxicity should receive more emphasis than rather transient unspecific or less severe foetotoxic effects such as slightly decreased foetal body weight or delayed skeletal maturation. Thus, determination of an adequate margin is a substance-specific process which will result in documentations based on different justifications.

## Taking into consideration developmental neurotoxicity

For substances whose MAK or BAT value is derived from a neurotoxic effect, information on developmental neurotoxicity has been included since 2016. Developmental neurotoxicity is taken into consideration also in the following cases: if the critical effect for the derivation of the MAK or BAT value is not neurotoxicity, but a substance has neurotoxic effects and neonatal or juvenile animals have been found to be more sensitive than adult animals for the substance-induced neurotoxic effects. The most suitable means of evaluating developmental neurotoxicity are studies with prenatal exposure and investigations of neurotoxic end points in developing or adult offspring which take into consideration the effects observed in adult animals, such as studies carried out according to test guidelines for developmental neurotoxicity (OECD Test Guideline 426) or extended one-generation studies (OECD Test Guideline 443) and other suitable studies of developmental neurotoxicity. In addition, relevant information on the toxicokinetics and mechanism of action are included. Possible developmental neurotoxicity is taken into consideration in the classification of the substance in a pregnancy risk group.

## Substances designated as suspected of causing developmental toxicity (Group B (suspected))

Substances which could not be clearly assigned to Pregnancy Risk Group A, B or C due to a lack of data or the incomplete investigation of developmental (neuro)toxicity were previously classified in Pregnancy Risk Group D. Substances for which a MAK or BAT value could not be established (listed in Section IIb) or which were classified in Carcinogen Category 1, 2 or 3 (without a MAK value) were previously not evaluated for prenatal toxicity. In 2024, a new group (Group B (suspected)<sup>52</sup>) was introduced to distinguish these substances based on their potential for causing prenatal toxicity. A substance is classified in this group if there are reasons to suspect a hazard potential, but no or insufficient data are available to carry out a risk assessment and establish a MAK or BAT value.

Mechanistic data from in vivo studies, primarily those carried out according to OECD Test Guidelines 421, 422, 426 or 443, and in some cases from in vitro studies can be used as evidence of a hazard potential. The evaluation must determine whether it is sufficiently plausible to assume a realistic risk for humans.

### Pregnancy risk groups

Based on the criteria mentioned, the Commission is evaluating substances with MAK or BAT values as to whether prenatal toxic effects are unlikely when the MAK value or the BAT value is observed (Group C), whether, according to the currently available information, such effects cannot be excluded (Group B) or whether they have been unequivocally demonstrated (Group A). Since 2024, every substance is investigated for its potential for causing prenatal toxicity (Group B (suspected)) if not enough data are available to make a reliable assessment of the risks in relation to the MAK or BAT value. For a number of substances, however, it is not yet possible to make a statement as to prenatal toxicity (Group D). This is described in detail in the respective documentation.

The following pregnancy risk groups are defined:

**Group A**: Damage to the embryo or foetus in humans has been unequivocally demonstrated and is to be expected even when MAK and BAT values are observed.

**Group B**: According to currently available information damage to the embryo or foetus cannot be excluded after exposure to concentrations at the level of the MAK and BAT values. The documentation indicates, when the Commission's assessment of the data makes it possible, which concentration would correspond to the classification in Pregnancy Risk Group C. Substances with this indication have the footnote "Note regarding prerequisite for Group C, see documentation".

**Group B (suspected)**: The available data give reason to suspect developmental toxicity, but are insufficient to make a reliable assessment of the risks in relation to the MAK or BAT value.

<sup>&</sup>lt;sup>52</sup>) Hartwig A, MAK Commission (2026) Pregnancy groups: new group B (suspected). MAK Value Documentation, addendum – Translation of the German version from 2026. MAK Collect Occup Health Saf 11: in preparation

**Group C**: Damage to the embryo or foetus is unlikely if the MAK value or the BAT value is observed.

**Group D**: Either there are no data for an assessment of damage to the embryo or foetus, including developmental neurotoxicity, or the currently available data are not sufficient for classification in one of the groups A, B or C or Group B (suspected).

Substances without a MAK or BAT value (carcinogenic substances or substances included in Section IIb) have no entry (–) or, if applicable, are assigned to Group B (suspected).

## IX. Germ cell mutagens

Germ cell mutagens produce heritable gene mutations and heritable structural and numerical chromosome aberrations in germ cells. The consequences of germ cell mutations in subsequent generations include genetically determined phenotypic alterations without signs of illness, reduction in fertility, embryonic or perinatal death, more or less severe congenital malformations, and genetic diseases with various degrees of health impairment. The term "germ cell mutagenicity" refers specifically to mutagenicity in male and female germ cells and is distinguished from mutagenicity in somatic cells which can initiate cancer.

Epidemiological studies, however, have been unable to provide any evidence as yet that exposure to chemicals or to radiation results in hereditary diseases in man. Although structural changes have been demonstrated in the chromosomes of the germ cells of men exposed to radiation, even this finding can only provide indirect evidence that such exposures could lead to hereditary disorders in the offspring. The proof that an increased frequency of hereditary diseases is related to a particular exposure would be associated with great methodological difficulties. In the human population there are a large number of hereditary diseases of unknown origin with frequencies which differ widely in different subpopulations. Since mutational events occur largely randomly in the genome, it is not to be expected that one particular substance would induce one characteristic genetic disease. Therefore, it is most unlikely that proof of a causal relationship between exposure to a chemical and occurrence of heritable diseases will become available in the foreseeable future.

In this situation, for the identification of germ cell mutagens the results of animal experiments must be given particular attention. The mutagenic effect of chemicals on the germ cells of exposed parent animals can be demonstrated by observing an increased mutant frequency among the progeny. In addition, the demonstration of genotoxic effects of a substance in germ cells or somatic cells provides evidence of a potential hazard for subsequent generations.

The categories for classification of germ cell mutagens have been established in analogy to the categories for carcinogenic chemicals at the workplace.

- 1. Germ cell mutagens which have been shown to increase the mutant frequency in the progeny of exposed humans
- Germ cell mutagens which have been shown to increase the mutant frequency in the progeny of exposed mammals
- 3A. Substances which have been shown to induce genetic damage in germ cells of humans or animals, or which produce mutagenic effects in somatic cells of mammals in vivo and have been shown to reach the germ cells in an active form
- 3B. Substances which are suspected of being germ cell mutagens because of their genotoxic effects in mammalian somatic cells in vivo; in exceptional cases, substances for which there are no in vivo data but which are clearly mutagenic in vitro and structurally related to known in vivo mutagens
- 4. not applicable (‡)
- 5. Germ cell mutagens or suspected substances (according to the definition of Category 3A and 3B), the potency of which is considered to be so low that, provided the MAK and BAT values are observed, their contribution to genetic risk for man is considered to be very slight
- (‡) Category 4 carcinogenic substances are those with non-genotoxic mechanisms of action. By definition, germ cell mutagens are genotoxic. Therefore, a Category 4 for germ cell mutagens cannot apply. At some time in the future it is conceivable that a Category 4 could be established for genotoxic substances with primary targets other than the DNA (e. g. purely aneugenic substances) if research results make this seem sensible.

# X. Substances requiring special consideration

### a) Organic peroxides

The inflammatory and caustic effects of organic peroxides on the skin and mucous membranes vary considerably. For some of these compounds, even very small amounts of very dilute solutions produce severe necrosis of the skin or the cornea, resulting in loss of eyesight. Inhalation of the vapours causes various degrees of irritation in the respiratory passages. In practice, the danger of systemic effects is low. Sensitizations of the immediate type have been observed after inhalation of these substances. With hydroperoxides and with certain peroxides contact sensitization may be expected as well.

A number of organic peroxides have produced mutagenic effects in in vitro tests. In addition, tumours have been produced in animal experiments with, e. g., diacetyl peroxide, tert-butyl peroxide, dilauroyl peroxide and  $\alpha,\alpha$ -dimethylbenzyl hydroperoxide.

### Effects on the skin in order of severity

	Di-tert-butyl peroxide	
Negligible or very weak effects on skin:	Dibenzoyl peroxide	(50 %)
,	Dilauroyl peroxide	(50 %)
Moderate effects on skin:	tert-Butylhydroperoxide	
Moderate effects on skin:	tert-Butyl peracetate	(50 %)
	α,α-Dimethylbenzyl hydroperoxide (Cumene hydroperoxide)	
	Methyl ethyl ketone peroxide (2-Butanone peroxide)	(40 %)
Very severe effects on skin:	Cyclohexanone peroxide mixtures	(50 %)
,	Dicyclohexyl peroxide	(50 %)
	Diacetyl peroxide	(30 %)
	Peroxyacetic acid	(40 %)

## b) Gasolines

The Commission could not agree to assign a MAK value to "gasolines" because this term describes a number of very different mixtures such as motor gasolines (petrol), special boiling point gasolines, white spirits and pyrolysis gasolines. The toxicity of gasolines depends primarily on their content of aromatic compounds (benzene, toluene, xylenes, ethyl benzene, cumene), which varies markedly with the production method.

Procedures suggested for establishing MAK values by the mathematical evaluation of the composition of such mixtures of liquid solvents must be rejected on principle because such calculations cannot provide information as to the actual concentrations in the workplace air. Only when results are available from studies with defined gasoline-vapour mixtures (see Section I) can the Commission make any concrete statements.

Levels of additives such as 1,2-dibromoethane and 1,2-dichloroethane must be evaluated independently.

#### c) Metal-working fluids, hydraulic fluids and other lubricants

#### **Definition**

Lubricants are lubricating media based on mineral oils, natural oils or synthetic liquids. Lubricants in liquid form are to be viewed like metal-working fluids (DIN 51385) and lubricating greases of varying consistencies (DIN 51825). Hydraulic fluids are also included (DIN 51524), which are used for power transmission in hydrostatic/hydrodynamic systems and at the same time may enter the metal-working process, for example due to contamination.

When lubricants are defined according to type or field of application, automotive lubricants (motor oils, transmission oils) are differentiated from industrial lubricants, such as metal-working fluids and hydraulic fluids.

Chemically, lubricants are a heterogeneous group and have a complex composition. Metal-working fluids contain various substances which are also found in other lubricants. Therefore the substances which before 2013

had been listed separately in the List of MAK and BAT Values and in the documentations are now combined<sup>53</sup>). Hydraulic fluids have numerous components in common with both groups and are therefore also discussed here.

## Metal-working fluids

Metal-working fluids are used to cool metallic workpieces and to increase the quality and speed of the cutting process (for example, turning, drilling, milling and cutting) and the service life of the tools.

During the shaping treatment and processing of workpieces (includes rolling and forming, for example), the fluids decrease friction and protect surfaces. They are subdivided into non-water miscible (earlier synonyms: honing oils, cutting oils, grinding oils and rolling oils) and water-miscible metal-working fluids. When used diluted with water, they are called water-mixed metal-working fluids, in practice also drilling fluid or emulsion and grinding water.

The modern non-water miscible metal-working fluids are generally multicomponent mixtures whose composition may vary considerably according to the intended use. They consist predominantly of base oils. These are either mineral oils (natural hydrocarbons, paraffinic or naphthenic), natural oils (such as rapeseed oils) or chemically synthesized oils such as synthetic ester oils (e. g. trimethyl propane esters and polyglycol ethers). Important technically desirable properties, such as load-carrying capacity, adjustment of the viscosity index and pour point are only achieved by including additives.

Essential additives are used for protection against wear, corrosion and ageing, as defoamers and as antimist additives and may also be surface-active substances (surfactants). Antioxidants prevent the degradation of lubricants, for example, while metal deactivators inhibit the catalytic activity and corrosion of non-ferrous metals.

Water-miscible metal-working fluids, which are typically used as water-mixed metalworking fluids at concentrations of 1-20 %, also contain additives such as emulsifiers, solubilisers, odour maskers and dyes. Biocides are used for the control of bacteria (preservation) in aqueous systems. As part of inspection/maintenance/care of water-mixed metal-working fluids, individual components may be added which do not always correspond to the original formulation of the manufacturer. For example, if there is increased bacterial growth, biocides might be added. Therefore, the composition may constantly vary in the course of time or during prolonged service lives.

The toxicological assessment of metal-working fluids is dependent on their composition and properties of their components, which differ greatly in number and proportion according to the intended use. The mineral oil component alone is therefore not representative of the potential effect. As a result, the MAK value of 5 mg/m³ previously established for pure mineral oil is not applicable to present-day metal-working fluids since these are generally mixtures whose composition may vary considerably according to the intended use. For this reason, it is not possible to establish a single MAK value for all types of metal-working fluids. It is a substantial disadvantage that there is no regulation requiring declaration of components of metal-working fluids. Therefore, it is virtually impossible to make a systematic evaluation. New components and compositions are to be expected with advancing technology. Disclosure of the composition is an absolute requirement for an adequate assessment by the Commission.

### Hydraulic fluids and other lubricants such as greases

Hydraulic fluids are operating liquids for hydrostatic/hydrodynamic power transmissions. They consist mainly of oils such as mineral oils, natural oils or synthetic fluids of varying structure and viscosity with additives (DIN 51524). The use of hydraulic fluids and other lubricants such as greases may involve intensive skin contact. Skin contact with components of hydraulic fluids results mainly when they are added to water-mixed metal-working fluids during metal working.

There are numerous applications for which liquid lubricants are not suitable (for example, plain and rolling bearings in machine tools). In these cases, greases covering a wide range of viscosity are used. From a physical point of view, greases are colloidal suspensions of thickeners in oils. Mainly metal soaps are used as thickeners, but also mineral substances and polymers.

### Hazards

Following skin contact, the effects on health expected most frequently are sensitizing and irritant effects on the skin in the sense of toxic irritant reactions or type IV sensitization (see Section IV "Sensitizing substances" and TRGS  $401^{54}$ )). Systemic toxicity as a result of skin absorption is, however, of minor importance.

MAK Collect Occup Health Saf 8(2): Doc034. <a href="https://doi.org/10.34865/mb0215khsdgt8">https://doi.org/10.34865/mb0215khsdgt8</a> 2ad

<sup>54)</sup> Ausschuss für Gefahrstoffe (2011) Gefährdung durch Hautkontakt – Ermittlungen, Beurteilung, Maßnahmen (TRGS 401). <a href="https://www.baua.de/DE/Angebote/Rechtstexte-und-Technische-Regeln/Regelwerk/TRGS/TRGS-401.html">https://www.baua.de/DE/Angebote/Rechtstexte-und-Technische-Regeln/Regelwerk/TRGS/TRGS-401.html</a>

When metal-working fluids are in use, it is possible for vapours resulting from high temperatures at the cutting edge and aerosols due to high rotation speeds to pass into the workplace atmosphere. To date, hardly any animal studies or epidemiological data are available for long-term effects following uptake in the lungs under working conditions. However, the toxic profiles of individual components which are absorbed in the lungs or dermally suggest evidence of a systemic toxic reaction. There may be irritant or toxic reactions in the respiratory tract and lungs following inhalation. It can be assumed that systemic toxicity and local effects on the skin and respiratory tract are mainly due to the additives.

Carcinogenic nitrosamines resulting from nitrosatable secondary amines such as diethanolamine and morpholine (see Section III "Amines which form carcinogenic nitrosamines on nitrosation"; see TRGS 552<sup>55</sup>) and 611<sup>56</sup>)), may be of potential toxicological relevance in water-mixed metal-working fluids, particularly if the fluids contain no inhibitors against their formation.

Both the nitrite concentration and the pH of the water-mixed metal-working fluid have substantial influence on formation of nitrosamines and the rate of their formation. Bacterial nitrite formation can be avoided by the addition of biocides.

Since the nitrosamine concentration does not always correlate with the nitrite concentration, it is more reliable to determine nitrosamine rather than nitrite levels in metal-working fluids containing secondary amines (these do not comply with TRGS 611, unless the provision in Paragraph 2.4 applies). In particular, the absence of nitrite at a particular sampling time does not rule out the possibility that nitrosamines are present. The use of non-water miscible metal-working fluids leads to the formation of polycyclic aromatic hydrocarbons (PAH; reference substance: benzo[a]pyrene). They form at non-critical concentrations if their mineral base oils are sufficiently refined or hydrogenated. According to TRGS 905<sup>57</sup>), the mass content of benzo[a]pyrene in the base oils of non-water miscible metal-working fluids should be lower than 0.005 % (50 ppm).

For systemically hardly toxic components of metal-working fluids which were assessed as non-irritating to mucous membranes and for which no MAK value can be established, it is pointed out that no adverse effects on health are expected at a concentration of up to 10 mg metal-working fluid/m³, which corresponds to the technical exposure limit of the German BGR/GUV-R 143, 2011<sup>58</sup>).

The Commission prepares toxicological/occupational-medical reviews of individual components with the aim of publishing practicable assessments in the form of MAK values, if possible. The list, which is subject to constant revision, should assist in the assessment of the effects of metal-working fluids, hydraulic fluids and other lubricants on a case by case basis and in taking any necessary action for health protection.

## d) Metals and metal compounds

In the List of MAK and BAT Values, metals are listed as the element "and its inorganic compounds"; the limit value is then expressed consistently in terms of the metal content. For the individual compounds of most metals, the data available from animal studies or from known effects on man are insufficient for evaluation. Whenever analogy of various compounds of a metal and the element itself seems plausible, these substances should be put in a single category. Therefore, it is necessary that the individual metal compounds be specified as exactly as possible. Generally organic metal compounds should be evaluated separately from the inorganic compounds with respect to the establishment of a MAK value and of carcinogenic potential.

And since the type and extent of metal-related damage depends markedly on the nature of the chemical bond, differences in water solubility of metal compounds can influence their acute and chronic toxicity. On principle, therefore, every metal compound should be tested individually and then categorized according to its toxicity and any carcinogenic potential. At present, sufficient data for such a classification is available for only a few metal compounds.

### e) Radioactive materials

For procedures in handling radionuclides, reference is made to the special regulations of the "Strahlenschutzverordnung" (radiation protection guidelines). The current version of the guideline may be found in the relevant issue of the "Bundesgesetzblatt".

# Assessment Values in Biological Material

# XI. Significance and use of assessment values in biological material

#### **Definition**

The Commission derives **assessment values in biological material** to enable the occupational-medical and toxicological evaluation of the individual body burden which results from exposure to a substance at the workplace.

The **BAT value** (Biologischer Arbeitsstoff-Toleranzwert, "biological tolerance value") describes the occupational-medical and toxicological derived concentration for a substance, or one or more of its metabolites or a reaction product of the agent with endogenous macromolecules (adducts) or a deviation of a biological indicator from its norm caused by the agent or its metabolites at which the health of an employee generally is not adversely affected even when the person is repeatedly exposed during long periods (see Section XIII).

In addition, the Commission examines all hazardous substances at the workplace with a BAT value with respect to whether prenatal toxicity occurs when the BAT value is observed and classifies them in the appropriate pregnancy risk groups (see Section XIII).

The **BLW** (Biologischer Leitwert, "biological guidance value") is the concentration of a chemical substance or its metabolites or the deviation from the norm of biological parameters induced by the substance in exposed humans which serves as an indicator for necessary protective measures (see Section XIV).

The **BAR** (Biologischer Arbeitsstoff-Referenzwert, "biological reference value") describes the background level of a substance which is present concurrently at a particular time in a reference population of persons of working age who are not occupationally exposed to this substance (see Section XV).

**EKA** (Expositionsäquivalente für **k**rebserzeugende **A**rbeitsstoffe, "exposure equivalents for carcinogenic substances") are established by the Commission for carcinogenic substances in the form of relationships between the concentration of the carcinogen in the workplace air and that of the substance or its metabolites in biological material (see Section XVI).

## **Prerequisites**

Assessment values in biological material can be established only for such substances which can be taken up via the respiratory tract, skin and gastrointestinal tract during occupational exposure. Another prerequisite for the establishment of assessment values is that sufficient occupational-medical and toxicological data are available for the substance and that these data are supported primarily by observations in man. The data must have been obtained with scientific methods. For the establishment of new assessment values and the annual review of the list, the submission of suggestions and reports of experience with such substances in man is requested.

## Documentation of the scientific evaluations

The reasons why assessment values in biological material were established at a particular level are documented by the Permanent Senate Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area in scientific evaluations which are published online in "The MAK Collection for Occupational Health and Safety" 59).

As a rule, the Commission makes its decisions regarding the establishment of assessment values on the basis of scientific texts which have undergone a peer review procedure. When necessary, after detailed discussion, other sources such as unpublished internal company reports are cited and are then identified as such in the reference list at the end of the documentation. The unabridged reports are made available to the Commission and are filed at the Commission's scientific central office. Information required by a third party about the company reports cited in the Commission's documentation is supplied in writing by the chair of the Commission at own discretion. Access to company reports is not made available to third parties.

<sup>59)</sup> available online under <a href="https://mak-dfg.publisso.de">https://mak-dfg.publisso.de</a>

## **Purpose**

In the context of specific occupational-medical check-ups, BAT values are intended to protect employees from impairment of health at work. They enable an occupational medical toxicological assessment of occupational exposure. For substances that can be absorbed through the skin, individual exposures can be determined only by biological monitoring.

#### Evaluation of the health risk

The protection of the health of the individual, which is the reason for establishing assessment values in biological material, can be monitored by periodic quantitative determination of the chemical compounds or their metabolites in biological material or of biological parameters. The methods used must be diagnostically specific and sensitive enough for the purpose, acceptable to the employee and practicable for the physician. The assessment values in biological material are only valid, if the specified sampling time and other requirements named in the evaluation texts are adhered to during sampling.

Ideally, samples should be taken when the parameter has reached a steady state after undergoing absorption and distribution processes, and sometimes also metabolic processes. On the one hand, the steady state may be reached in as little as a few minutes. This is the case for exposure markers that do not require extensive distribution processes and for which metabolism plays only a minor role, such as when concentrations of aromatic substances or halogenated hydrocarbons are determined in the blood. On the other hand, it often takes several hours for the concentrations of metabolites in the urine to reach the steady state. Alternatively, different sampling times may be chosen depending on the kinetics of the substance (for example, before the next shift).

For parameters underlying extremely rapid elimination kinetics (elimination half-lives of < 1 hour), the samples must be taken immediately after the end of exposure (for example, when determining the concentrations of most of the highly volatile hazardous substances in blood. These have short half-lives and are exhaled via the respiratory passages). Exposure situations at the workplace sometimes vary considerably. As a result, the (short-term) exposure levels determined immediately before sampling do not reliably represent the level of exposure over the whole working day.

Persistent chemical agents and accumulating substances, however, are successively stored in the body during long-term exposure and it may take a long time (weeks, months or years) to reach a steady state. It is important, therefore, to consider the half-life of the parameter, particularly at the beginning of occupational exposure to a new substance and after work breaks without exposure such as holidays<sup>60</sup>). If a marked increase in a specific parameter is found in consecutive samples, particularly at the beginning of occupational exposure to a new substance, exposure may already have reached a level that is hazardous to the health, even if the values are (still) below the assessment value. Therefore, it may be necessary to carry out a number of determinations in order to demonstrate early on that there is a risk of exceeding the assessment value.

Whole blood, serum and urine samples are used as assay materials, occasionally and under certain conditions, also samples of alveolar air. The analyses should be carried out under the conditions of statistical quality control according to the requirements of the guidelines of the German Medical Association for quality assurance of medical laboratory analyses (Richtlinien der Bundesärztekammer zur Qualitätssicherung laboratoriumsmedizinischer Untersuchungen (RiLiBÄK)) and the occupational medical rule (Arbeitsmedizinische Regel, AMR) 6.2 Biomonitoring. The Commission's working group "Analyses in Biological Materials" has compiled a series of valid and recognised methods<sup>61</sup>).

For workers who come into direct skin contact with substances which are designated with an "H", it is particularly necessary to check that the assessment values have not been exceeded or, in the case of carcinogenic substances, to assess the systemic dose in terms of the EKA.

## Evaluation of analytical data

Results from analyses of substances in biological material can only be interpreted with occupational-medical and toxicological knowledge and in Germany are subject to medical discretion.

In occupational-medical health practice analyses of urine specimens for the purpose of biological monitoring are carried out using spontaneously voided urine samples (spot urine samples). These are not suitable for an

<sup>60)</sup> Weistenhöfer W, Göen T, Drexler H, Hartwig A, MAK Commission (2023) Requirements for a suitable human biomonitoring parameter. Assessment values in biological material - Translation of the German version from 2023. <sup>61)</sup> available online under <a href="https://mak-dfg.publisso.de">https://mak-dfg.publisso.de</a>

analysis if they have been highly concentrated or highly diluted through diuresis. In occupational-medical practice the creatinine content of the urine specimen is used as a criterion for the specimen's acceptance while the specific weight or the osmolality is of little importance as a basis for evaluation. Creatinine concentrations < 0.3 g/l or > 3.0 g/l are criteria which would exclude the usability of the spot urine sample<sup>62</sup>).

### XII. List of substances

For interpretation of the occupational-medical and experimental toxicological data, reference should also be made to "The MAK Collection for Occupational Health and Safety"<sup>63</sup>).

#### Abbreviations

BV = assessment values in biological material (BAT/EKA/BLW/BAR)

BAT = biological tolerance value ("Biologischer Arbeitsstoff-Toleranzwert", see Section XIII)

BLW = biological guidance value ("Biologischer Leitwert", see Section XIV)

BAR = biological reference value ("Biologischer Arbeitsstoff-Referenzwert", see Section XV)

EKA = exposure equivalents for carcinogenic substances ("Expositionsäquivalente für krebserzeugende Arbeitsstoffe", see Section XVI)

#### In the table under Substance

Perc abs: H = danger from percutaneous absorption (see Sections VII and XI)

Carc cat = Carcinogen category (see Section III)

Preg(BAT): = Pregnancy Risk Group for BAT value (see Section XIII)

#### Assay material:

B = whole blood

 $B_E$  = erythrocyte fraction of whole blood

U = urine

P/S = plasma/serum

#### Sampling time:

 $a \hspace{1cm} = \hspace{1cm} \text{not fixed in the steady state}$ 

These substances have long half-lives. As a result, it may take a long time (weeks, months or years) to reach a steady state after taking up or resuming an activity at the workplace. More information can be found in the substance documentation.

b = end of exposure or end of shift

c = at the end of the shift, for long-term exposures after several previous shifts

d = at the beginning of the next shift
e = time after end of exposure: ... hours
f = after exposure for at least 3 months

g = immediately after exposure

h = at the end of the shift, for long-term exposure after several previous shifts; determination of individual

pre-exposure values for use as reference values (see documentation)

i = at the end of the shift on the last day of the working week after at least 2 weeks of exposure

<sup>63)</sup> available online under https://mak-dfg.publisso.de

### XIII. Biological Tolerance Values (BAT values)

The Commission establishes BAT values ("Biologische Arbeitsstoff-Toleranzwerte": biological tolerance values) to enable the occupational-medical and toxicological evaluation of the risk to an individual's health which results from exposure to a substance at the workplace. The BAT value describes the average occupational-medical and toxicological derived concentration for a substance, or one or more of its metabolites or a reaction product of the agent with endogenous macromolecules (adducts) or a deviation of a biological indicator from its norm caused by the agent or its metabolites at which the health of an employee generally is not adversely affected even when the person is repeatedly exposed during long periods. As a rule, exposure to the substance is assumed for the whole of working life. BAT values are based on a relationship between external and systemic exposure or between the systemic exposure and the resulting effect of the substance.

The BAT value is exceeded when, following several individual examinations, the average concentration of the parameter is greater than the BAT value; individual measured values greater than the BAT value must be evaluated in relation to occupational-medical and toxicological data. Adverse effects on health can not necessarily be deduced from one single excursion above the BAT value. This is not valid for acute toxicity, which must not be permitted at any time. The individual evaluations of substances include evidence of acute toxic effects. Substances with a BAT value which targets an acute toxic effect are marked accordingly in the List of MAK and BAT Values ("derivation of the BAT value as ceiling value because of acute toxic effects").

#### **Derivation of BAT values**

The derivation of a BAT value can be based on various constellations of scientific data.

- Studies in humans which reveal a direct relationship between concentrations of a substance or metabolites in biological material (internal exposure) and adverse effects on health are preferred, or
- studies in humans which reveal a relationship between a biological indicator (effect parameter) and adverse effects on health.
- If such information is not available, studies are preferred which reveal a quantitative relationship between exposure concentration and internal exposure and therefore permit the linking of MAK and BAT values.
- In individual cases, the assessment value is derived from a NOAEL from experiments with animals by means
  of a human toxicokinetic model.

The following considerations of sex-specific factors apply for the establishment of BAT-values:

- 1. The range of the variation in toxicokinetics and the anatomical and physiological characteristics in humans is very wide even for a single sex; the ranges for the two sexes overlap.
- 2. The resulting sex-specific differences in toxicokinetics generally vary in a range which is insignificant compared with the uncertainty involved in establishing limit values.
- 3. During pregnancy and breast-feeding, certain changes in the toxicokinetics of xenobiotics can occur. In practice, however, the effects of these changes are limited so that for health protection at the workplace the effects on the unborn child and the breast-fed baby are of particular importance (see Section VIII "MAK values and pregnancy").

BAT values are not suitable for the derivation of biological assessment values for exposures from the general environment by means of fixed conversion factors.

### Correlations between BAT and MAK values

When a substance is inhaled under steady state conditions in controlled laboratory experiments, the relationship between the external exposure and the internal exposure can be expressed in terms of toxicokinetics. As a result of the conditions at the workplace, it is not necessarily possible to deduce the internal exposure from the concentration of certain substances in the air, and vice versa. In addition to inhalation of the substance, a series of other factors can determine the extent of exposure of the organism. These factors include for example the level of physical activity (respiratory minute volume), absorption through the skin and individual variations in metabolic or excretory patterns.

In general, for substances with low vapour pressure which are readily absorbed through the skin, there is no correlation between the external and internal exposure. For these substances a BAT value can therefore be established only on the basis of a relationship between the internal exposure and effect.

The concentrations of substances in the workplace air may vary with time and the biological parameters may not vary to the same extent. Therefore, the levels in the air cannot always be deduced from the results of investigations in biological material.

In spite of all these influencing factors and the consequent differences in the definitions of MAK and BAT values, the two limit values are based on equivalent effects of substances on the organism. Exceptions are substances for which the MAK value was not established on the basis of systemic effects but because of local irritation of skin and mucous membranes. In these cases the BAT value can still be based on "critical toxicity" resulting from systemic exposure, so that the MAK and BAT values may then be based on different end points.

### **BAT** values and pregnancy

Observance of the BAT values does not guarantee the protection of the unborn child in every case, as for numerous hazardous substances at the workplace there are no or no adequate studies of their prenatal toxicity. On the basis of the prerequisites named in Section VIII "MAK values and pregnancy", the Commission examines all hazardous substances at the workplace with MAK or BAT values with respect to whether prenatal toxicity occurs when the MAK or BAT value is observed.

If there is a correlation between the MAK and BAT values, the pregnancy risk group for the MAK value usually applies also for the correlating BAT value.

If the BAT value was not derived in correlation with the MAK value, a procedure like that described in Section VIII "MAK values and pregnancy" is followed for the pregnancy risk group for the BAT value.

### Allergenic substances

Depending on individual disposition, allergic reactions can be induced by various kinds of substances, more or less rapidly and in differing degrees of severity after sensitization of, for example, the skin or respiratory passages. The observance of BAT values cannot provide a guarantee that such reactions will not occur.

### Mixtures of substances

BAT values apply as a rule for exposure to pure substances. They are not necessarily applicable for persons exposed to preparations containing more than one toxic substance (blends, mixtures, solutions). For mixtures of components with similar effects, a BAT value based on a biological parameter can be helpful in the assessment of health risks, as long as it provides a measure of critical clinical-functional effects of the components. The Commission makes every effort to define and publish such criteria for the biological effects of interfering components of mixtures.

### 1 Substances for which BAT values can be derived:

Acetone [67-64-1] Aluminium [7429-90-5] Aniline [62-53-3] 1-Butanol [71-36-3] 2-Butanone (Methyl ethyl ketone) [78-93-3] 2-Butoxyethanol [111-76-2] 2-Butoxyethyl acetate [112-07-2] p-tert-Butylphenol (ptBP) [98-54-4] Carbon disulfide [75-15-0] Carbon monoxide [630-08-0] Chlorinated biphenyls [1336-36-3] Chlorobenzene [108-90-7] Cyclohexane [110-82-7] 1,2-Dichlorobenzene [95-50-1] 1,4-Dichlorobenzene [106-46-7] Dichloromethane [75-09-2] Diethylene glycol dimethyl ether [111-96-6] Diethylene glycol monomethyl ether [111-77-3] N,N-Dimethylacetamide [127-19-5] N,N-Dimethylformamide [68-12-2] 1,4-Dioxane [123-91-1] 1,2-Epoxypropane (1,2-Propylene oxide) [75-56-9] 2-Ethoxyethanol [110-80-5] 2-Ethoxyethyl acetate [111-15-9]

```
Ethylbenzene [100-41-4]
 Halothane (2-Bromo-2-chloro-1,1,1-trifluoroethane) [151-67-7]

 Hexachlorobenzene [118-74-1]
 1,6-Hexamethylene diisocyanate [822-06-0]
 n-Hexane [110-54-3]
 2-Hexanone [591-78-6]
 Hydrogen fluoride [7664-39-3] and inorganic fluorine compounds (fluorides)
 Isoflurane [26675-46-7]
 Isopropylbenzene (cumene) [98-82-8]
 Lead [7439-92-1] and its inorganic compounds (except lead arsenate and lead chromate)
 Lindane (γ-1,2,3,4,5,6-Hexachlorocyclohexane) [58-89-9]
 Mercury [7439-97-6] and its inorganic compounds
 Methanol [67-56-1]
 Methoxyacetic acid [625-45-6]
 2-Methoxyethanol [109-86-4]
 2-Methoxyethyl acetate [110-49-6]
 1-Methoxy-2-propanol [107-98-2]
 4-Methyl-2-pentanone (Methyl isobutyl ketone) [108-10-1]
 N-Methyl-2-pyrrolidone [872-50-4]
 Perfluorooctanesulfonic acid (PFOS) [1763-23-1] and its salts
 Perfluorooctanoic acid (PFOA) [335-67-1] and its salts
 2-Propanol [67-63-0]
 Selenium [7782-49-2] and its inorganic compounds
 Styrene [100-42-5]
 Tetrachloroethene [127-18-4]
 Tetrachloromethane (Carbon tetrachloride) [56-23-5]
★ Tetrahydrofuran [109-99-9]
 Toluene [108-88-3]
 2,4-Toluene diisocyanate [584-84-9]
 2,6-Toluene diisocyanate [91-08-7]
 Toluene diisocyanates, mixture [26471-62-5]
 1,1,1-Trichloroethane (Methyl chloroform) [71-55-6]
 Trimethylbenzene (all isomers) [25551-13-7]: 1,2,3-Trimethylbenzene [526-73-8], 1,2,4-Trimethylbenzene [95-63-6],
     1,3,5-Trimethylbenzene [108-67-8]
 Vitamin K antagonists
 Xylene (all isomers) [1330-20-7]
```

2 For the substances listed below, there is at present insufficient data for the derivation of a BAT value; however, documentation for these substances has been published in "The MAK Collection for Occupational Health and Safety"65):

```
Acetylcholinesterase inhibitors
Boric acid [10043-35-3] and tetraborates
Copper [7440-50-8] and its inorganic compounds
Cresol (all isomers) [1319-77-3]: o-cresol [95-48-7], m-cresol [108-39-4], p-cresol [106-44-5]
1-Ethoxy-2-propanol [1569-02-4]
1-Ethoxy-2-propyl acetate [54839-24-6]
Ethylene glycol dinitrate [628-96-6]
Manganese [7439-96-5] and its inorganic compounds
Mercury, organic compounds
Methaemoglobin-forming substances
Methyl tert-butyl ether [1634-04-4]
Methyl formate [107-31-3]
Molybdenum [7439-98-7] and its compounds
Neuropathy target esterase inhibitors
Parathion [56-38-2]
Pyrethrum [8003-34-7] and pyrethroids (e. g. allethrin, cyfluthrin, cypermethrin, deltamethrin, permethrin, phenothrin,
   resmethrin, tetramethrin)
Tetraethyllead [78-00-2]

## XIV. Biological Guidance Values (BLW)

The BLW ("biological guidance value") is the average concentration of a chemical substance or its metabolites or the deviation from the norm of biological parameters induced by the substance in exposed humans which serves as an indicator for necessary protective measures. BLWs are assigned only for hazardous substances for which the available toxicological or occupational-medical data are insufficient for the establishment of BAT values (i. e. for carcinogenic substances and suspected carcinogens). BLW values are established on the assumption that persons are exposed for their entire working lives.

The BLW is based on occupational-medical information as to the effects of handling the hazardous material together with toxicological data. Since observance of the BLW does not exclude a risk of adverse effects on health, it is necessary to extend our knowledge of the relationships between exposure to the substance, the systemic dose and the resulting risks for health, so that BAT values may be derived.

The BLW is exceeded if, in several examinations of one person, the mean concentration of the parameter is above the BLW. Individual measured values above the BLW must be assessed from the point of view of occupational medicine and toxicology.

1 Substances for which BLW can be derived:

Acetylcholinesterase inhibitors Acrylamide [79-06-1] Aniline [62-53-3] Arsenic [7440-38-2] and inorganic arsenic compounds (except for arsine) Bisphenol A (4,4'-Isopropylidenediphenol) [80-05-7] Bromomethane (Methyl bromide) [74-83-9] Cadmium [7440-43-9] and its inorganic compounds Cobalt [7440-48-4] and cobalt compounds **★** 1,3-Dichlorobenzene [541-73-1] Di(2-ethylhexyl)phthalate (DEHP) [117-81-7] 4,4'-Methylene diphenyl diisocyanate (MDI) [101-68-8] Nitrobenzene [98-95-3] Parathion [56-38-2] Phenol [108-95-2] Tetraethyllead [78-00-2] Tetramethyllead [75-74-1]

2 For the substances listed below, there is at present insufficient data for the derivation of a BLW; however, documentation for these substances has been published in "The MAK Collection for Occupational Health and Safety" (6):

```
4-Aminobiphenyl [92-67-1]
Cresol (all isomers) [1319-77-3]: o-cresol [95-48-7], m-cresol [108-39-4], p-cresol [106-44-5]
4,4'-Diaminodiphenylmethane [101-77-9]
Indium [7440-74-6] and its inorganic compounds
1,5-Naphthylene diisocyanate [3173-72-6]
Nitroglycerin [55-63-0]
```

<sup>66)</sup> available online under https://mak-dfg.publisso.de

## XV. Biological Reference Values (BAR)

The BAR ("biological reference value") represents the internal exposure to a substance at a particular time of a reference population of persons of working age who are not occupationally exposed to this substance (background exposure). This background exposure may (also) have an endogenous cause.

The reference level for a substance or its metabolite in biological material is derived with the help of the measured level in a random sample from a defined population group. The BAR is based on the 95<sup>th</sup> percentile without regarding effects on health. It must be taken into account that the background exposure and thus also the reference level can be influenced by such factors as age, sex, social status, residential environment, life style and geographical region. For substances which occur also in tobacco smoke, the BAR is generally derived only for non-smokers.

Occupational exposure can be assessed by comparing biomonitoring values in occupationally exposed persons with the BAR, provided the sampling time is observed.

### 1 Substances for which a BAR can be derived:

Acetone [67-64-1] Acrolein (2-Propenal) [107-02-8] Acrylamide [79-06-1] Acrylonitrile [107-13-1] Aluminium [7429-90-5] 4-Aminobiphenyl [92-67-1]

★ Aniline [62-53-3]

Antimony [7440-36-0] and its inorganic compounds (except for stibine)

Arsenic [7440-38-2] and inorganic arsenic compounds (except for arsine)

Barium compounds, soluble (as Ba [7440-39-3])

Benzene [71-43-2]

Beryllium [7440-41-7] and its inorganic compounds

Bisphenol S [80-09-1]

1,3-Butadiene [106-99-0]

Butylated hydroxytoluene (BHT) [128-37-0]

Cadmium [7440-43-9] and its inorganic compounds

Chlorinated biphenyls [1336-36-3]

★ p-Chloroaniline [106-47-8]

Chloroprene (2-Chloro-1,3-butadiene) [126-99-8]

Chromium [7440-47-3] and its compounds

Cobalt [7440-48-4] and cobalt compounds

4,4'-Diaminodiphenylmethane [101-77-9]

1,4-Dichlorobenzene [106-46-7]

1,2-Epoxypropane (1,2-Propylene oxide) [75-56-9]

Ethylene oxide [75-21-8]

Glycidol [556-52-5]

Lead [7439-92-1] and its inorganic compounds (except lead arsenate and lead chromate)

★ Lithium compounds, inorganic (as Li [7439-93-2])

Manganese [7439-96-5] and its inorganic compounds

4,4'-Methylenebis(2-chloroaniline) (MOCA) [101-14-4]

Molybdenum [7439-98-7] and its compounds

Naphthalene [91-20-3]

Nickel [7440-02-0] and its compounds

Polycyclic aromatic hydrocarbons (PAH)

Selenium [7782-49-2] and its inorganic compounds

o-Toluidine [95-53-4]

Tributyl phosphate [126-73-8]

Trichloroethene [79-01-6]

2,4,6-Trinitrotoluene [118-96-7] (and isomers in technical mixtures)

Vanadium [7440-62-2] and its inorganic compounds

Vinyl chloride [75-01-4]

**2** For the substances listed below, there is at present insufficient data for the derivation of a BAR; however, documentation for these substances has been published in "The MAK Collection for Occupational Health and Safety"<sup>67</sup>):

Benzidine [92-87-5]
Copper [7440-50-8] and its inorganic compounds
1,2-Dichloropropane [78-87-5]
Gadolinium [7440-54-2]
Indium [7440-74-6] and its inorganic compounds
Iodine [7553-56-2] and inorganic iodides
2-Naphthylamine [91-59-8]
2,4-Toluenediamine [95-80-7]
2,4-Toluene diisocyanate [584-84-9]
Tricresyl phosphate, sum of all o-isomers [78-30-8]
Uranium [7440-61-1] and its hardly soluble inorganic compounds
Uranium compounds, soluble inorganic

## XVI. Exposure equivalents for carcinogenic substances (EKA)

For chemical substances which, by their own action or by that of their reactive intermediates or metabolites, are known to cause cancer in man or for which there is good evidence of a human cancer risk (Carcinogen categories 1 and 2) or which cause concern because they are or could be carcinogenic (Carcinogen category 3) and for which no MAK value can be derived, also no BAT values are derived. Therefore, the handling of such substances must take place under the conditions described in Section III of the List of MAK and BAT Values. For substances in Carcinogen categories 3, 4 and 5, BAT values are derived, if there are sufficient data. For carcinogenic substances and suspected carcinogens for which there are insufficient data for the derivation of a BAT value or the conditions for deriving a BAT value are not fulfilled, a BLW can be established.

In order to be able to evaluate internal exposure in the case of carcinogenic substances, the Commission investigates the relationships between the concentration of the carcinogen in the workplace air and that of the substance or its metabolites in biological material ("Expositionsäquivalente für krebserzeugende Arbeitsstoffe", EKA: exposure equivalents for carcinogenic substances). From these relationships, the expected internal exposure which results from uptake of the substance exclusively by inhalation may be determined.

1 Carcinogenic substances and suspected carcinogens for which correlations ("exposure equivalents for carcinogenic substances", EKA) can be evaluated:

(printed in italics: Equivalent Values according to ERB (=exposure-risk relationships as defined in "Risk-related concept of measures for activities involving carcinogenic hazardous substances (TRGS 910)" <sup>68</sup>))

### Acrylamide [79-06-1] H

	Sampling time: after exposure for at least 3 months
Air	Erythrocyte fraction of whole blood
Acrylamide	N-(2-Carbonamideethyl)valine
[mg/m³]	[pmol/g globin]
0.035	200
0.07	400
0.10	550
0.15	800
0.30	1600

### Acrylonitrile [107-13-1] H

		Sampling time: after exposure for at least 3 months	
Air		Erythrocyte fraction of whole blood	
Acrylonitrile		N-(2-Cyanoethyl)valine	
$[ml/m^3]$	$[mg/m^3]$	[pmol/g globin]	
0.12	0.26	650	
0.23	0.5	1400	
0.45	1	2450	
1.2	2.6	6500	
3	7	17 000	

<sup>68)</sup> Ausschuss für Gefahrstoffe (2014) Risikobezogenes Maßnahmenkonzept für Tätigkeiten mit krebserzeugenden Gefahrstoffen (TRGS 910). https://www.baua.de/DE/Angebote/Rechtstexte-und-Technische-Regeln/Regelwerk/TRGS/TRGS-910.html

## Alkali chromates (Cr(VI) compounds)

**H** (the chromates of barium, lead, strontium and zinc are not designated with "H")

	Sampling time: after exposure for at least 3 months	Sampling time: end of exposure or end of shift
Air	Erythrocyte fraction of whole blood <sup>a)</sup>	Urine <sup>b)</sup>
CrO <sub>3</sub>	Chromium	Chromium
[mg/m³]	[µg/l whole blood]	[μg/l]
0.03	9	12

25	137	50

2 Carcinogenic substances and suspected carcinogens for which correlations ("exposure equivalents for carcinogenic materials", EKA) cannot be evaluated, or only evaluated incompletely, but which are documented in "The MAK Collection for Occupational Health and Safety" 69):

4-Aminobiphenyl [92-67-1]

Antimony [7440-36-0] and its inorganic compounds (except for stibine)

Benzidine [92-87-5]

Beryllium [7440-41-7] and its inorganic compounds

Bromomethane (Methyl bromide) [74-83-9]

Ethylene [74-85-1]

Hydrazine [302-01-2]

Mercury, organic compounds

2-Naphthylamine [91-59-8]

Nickel (easily soluble nickel compounds, e. g. nickel acetate and similar soluble salts, nickel chloride, nickel sulfate)

Pentachlorophenol [87-86-5]

Vanadium [7440-62-2] and its inorganic compounds

Vinyl chloride [75-01-4]

<sup>&</sup>lt;sup>69</sup>) available online under <a href="https://mak-dfg.publisso.de">https://mak-dfg.publisso.de</a>

## **CAS Number Index**

CAS numbers of the substances listed in Sections II to XVI and on the announcement list

CAS number	Substance
50-00-0	Formaldehyde
50-29-3	DDT (Dichlorodiphenyltrichloroethane)
50-32-8	Benzo[a]pyrene
50-53-3	Chlorpromazine (2-chloro-10-(3-dimethylaminopropyl)phenothiazine)
51-75-2	N-Methyl-bis(2-chloroethyl)amine (nitrogen mustard)
51-79-6	Carbamic acid ethyl ester
52-51-7	2-Bromo-2-nitro-1,3-propanediol
53-70-3	Dibenzo[a,h]anthracene
54-11-5	Nicotine
54-64-8	Thimerosal
55-18-5	N-Nitrosodiethylamine
55-38-9	Fenthion
55-63-0	Nitroglycerin
56-23-5	Tetrachloromethane
56-38-2	Parathion
56-55-3	Benzo[a]anthracene
56-81-5	Glycerol
57-10-3	Palmitic acid
57-11-4	Stearic acid
57-12-5	Cyanides
57-14-7	1,1-Dimethylhydrazine
57-24-9	Strychnine
57-55-6	Propylene glycol
57-57-8	β-Propiolactone
57-74-9	Chlordane
58-89-9	Lindane
59-50-7	p-Chloro-m-cresol
59-89-2	N-Nitrosomorpholine
60-00-4	Ethylenediaminetetraacetic acid (EDTA)
60-09-3	p-Aminoazobenzene
60-12-8	2-Phenyl-1-ethanol
60-29-7	Ethyl ether
60-34-4	Monomethylhydrazine
60-35-5	Acetamide
60-57-1	Dieldrin
61-82-5	Amitrole
62-23-7	4-Nitrobenzoic acid
62-53-3	Aniline
62-56-6	Thiourea
62-73-7	Dichlorvos
62-74-8	Sodium fluoroacetate
62-75-9	N-Nitrosodimethylamine
63-25-2	Carbaryl (1-naphthyl methylcarbamate)
64-17-5	Ethanol
64-18-6	Formic acid
64-19-7	Acetic acid
64-67-5	Diethyl sulfate
65-85-0	Benzoic acid
67-56-1	Methanol
67-63-0	2-Propanol
67-64-1	Acetone

CAS number	Substance
67-66-3	Chloroform (Trichloromethane)
67-68-5	Dimethyl sulfoxide
67-72-1	Hexachloroethane
68-11-1	Thioglycolic acid
68-12-2	N,N-Dimethylformamide
71-36-3	1-Butanol
71-41-0	Pentanol (isomers): 1-Pentanol
71-43-2	Benzene
71-55-6	1,1,1-Trichloroethane
72-20-8	Endrin
72-43-5	Methoxychlor (DMDT)
74-11-3	Chlorobenzoic acid (all isomers): p-Chlorobenzoic acid
74-31-7	N,N-Diphenyl-p-phenylenediamine
74-83-9	Bromomethane
74-85-1	Ethylene
74-87-3	Chloromethane
74-88-4	Iodomethane
74-89-5	Methylamine
74-90-8	Hydrogen cyanide
74-93-1	Methanethiol
74-96-4	Bromoethane
74-97-5	Bromochloromethane
74-98-6	Propane
74-99-7	Methyl acetylene
75-00-3	Chloroethane
75-01-4	Vinyl chloride
75-04-7	Ethylamine
75-05-8	Acetonitrile
75-07-0	Acetaldehyde
75-08-1	Ethanethiol
75-09-2	Dichloromethane
75-12-7	Formamide
75-15-0	Carbon disulfide
75-18-3	Dimethyl sulfide
75-21-8	Ethylene oxide
75-25-2	Tribromomethane
75-27-4	Bromodichloromethane
75-28-5	Butane (both isomers): Isobutane
75-31-0	2-Aminopropane
75-34-3	1,1-Dichloroethane
75-35-4	1,1-Dichloroethene
75-38-7	1,1-Difluoroethylene
75-43-4	Dichlorofluoromethane
75-44-5	Phosgene
75-45-6	Chlorodifluoromethane
75-50-3	Trimethylamine
75-52-5	Nitromethane Propylogo imino
75-55-8	Propylene imine
75-56-9	1,2-Epoxypropane Dibromodifluoromethane
75-61-6 75-63-8	Dibromodificoromethane  Bromotrifluoromethane
75-63-8 75-64-0	
75-64-9	tert-Butylamine tert-Butanol
75-65-0 75-66-1	
75-66-1 75-68-3	2-Methyl-2-propanethiol 1-Chloro-1,1-difluoroethane
	Trichlorofluoromethane
75-69-4	Themoromonomethane

CAS number	Substance
75-71-8	Dichlorodifluoromethane
75-72-9	Chlorotrifluoromethane (FC-13)
75-74-1	Tetramethyllead
75-83-2	Hexane (all isomers except n-hexane) and methylcyclopentane: 2,2-Dimethylbutane
75-84-3	Pentanol (isomers): 2,2-Dimethyl-1-propanol
75-85-4	Pentanol (isomers): 2-Methyl-2-butanol
75-91-2	tert-Butyl hydroperoxide
75-99-0	2,2-Dichloropropionic acid
76-01-7	Pentachloroethane
76-03-9	Trichloroacetic acid
76-06-2	Trichloronitromethane
76-11-9	1,1,1,2-Tetrachloro-2,2-difluoroethane
76-12-0	1,1,2,2-Tetrachloro-1,2-difluoroethane
76-13-1	1,1,2-Trichloro-1,2,2-trifluoroethane
76-14-2	1,2-Dichloro-1,1,2,2-tetrafluoroethane
76-22-2	Camphor
76-44-8	Heptachlor
77-47-4	Hexachlorocyclopentadiene
77-73-6	Dicyclopentadiene
77-78-1	Dimethyl sulfate
77-92-9	Citric acid
78-00-2	Tetraethyllead
78-10-4	Silicic acid tetraethyl ester
78-18-2	1-Hydroxy-1'-hydroperoxydicyclohexyl peroxide
78-30-8	Tricresyl phosphate, sum of all o-isomers
78-32-0	Tricresyl phosphate, isomers, "free of o-isomers"
78-59-1	Isophorone
78-78-4	Pentane (all isomers): Isopentane
78-79-5	Isoprene (2-methyl-1,3-butadiene)
78-81-9	Isobutylamine
78-83-1	Isobutanol
78-87-5	1,2-Dichloropropane
78-92-2	2-Butanol
78-93-3	2-Butanone
78-94-4	Methyl vinyl ketone
78-96-6	1-Amino-2-propanol
79-00-5	1,1,2-Trichloroethane
79-01-6	Trichloroethene
79-01-0	Chloroacetyl chloride
79-04-7	Acrylamide
79-07-2	2-Chloroacetamide
79-07-2 79-09-4	Propionic acid
79-10-7	Acrylic acid
	Monochloroacetic acid
79-11-8	
79-20-9	Methyl acetate
79-21-0	Peracetic acid
79-22-1	Chloroformic acid methyl ester
79-24-3	Nitroethane
79-27-6	1,1,2,2-Tetrabromoethane
79-29-8	Hexane (all isomers except n-hexane) and methylcyclopentane: 2,3-Dimethylbutane
79-34-5	1,1,2,2-Tetrachloroethane
79-41-4	Methacrylic acid
	Dichloroacetic acid
79-43-6	
79-44-7	Dimethylcarbamoyl chloride

CAS number	Substance
80-05-7	Bisphenol A
80-09-1	Bisphenol S
80-15-9	α,α-Dimethylbenzyl hydroperoxide
80-62-6	Methacrylic acid methyl ester
81-81-2	Warfarin
81-84-5	1,8-Naphthalic anhydride
83-79-4	Rotenone
84-74-2	Di-n-butyl phthalate
85-01-8	Phenanthrene
85-42-7	Hexahydrophthalic anhydride
85-44-9	Phthalic anhydride
85-68-7	Benzylbutyl phthalate
86-30-6	N-Nitrosodiphenylamine
86-50-0	Azinphos-methyl
86-57-7	1-Nitronaphthalene
86-88-4	1-Naphthylthiourea
87-59-2	Xylidine (isomers): 2,3-Xylidine
87-61-6	1,2,3-Trichlorobenzene
87-62-7	2,6-Xylidine
87-68-3	Hexachloro-1,3-butadiene
87-86-5	Pentachlorophenol
88-10-8	Diethylcarbamoyl chloride
88-12-0	N-Vinyl-2-pyrrolidone
88-72-2	2-Nitrotoluene
88-73-3	o-Chloronitrobenzene
88-88-0	Picryl chloride
88-89-1	Picric acid
88-99-3	o-Phthalic acid
90-04-0	o-Anisidine
90-30-2	N-Phenyl-1-naphthylamine
90-43-7	o-Phenylphenol
90-66-4	2,2'-Thiobis(4-methyl-6-tert-butylphenol)
90-94-8	Michler's ketone
91-08-7	Toluene diisocyanates: 2,6-Toluene diisocyanate
91-17-8	Decahydronaphthalene
91-20-3	Naphthalene
91-23-6	2-Nitroanisole
91-29-2	4-Nitro-4'-aminodiphenylamine-2-sulfonic acid
91-59-8	2-Naphthylamine
91-94-1	3,3'-Dichlorobenzidine
91-95-2	3,3'-Diaminobenzidine and its tetrahydrochloride
92-52-4	Biphenyl
92-67-1	4-Aminobiphenyl

## Constitution and Procedures of the Permanent Senate Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area

I.

The activity of the Permanent Senate Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area is based on the following regulations of the statutes of the Deutsche Forschungsgemeinschaft (German Research Foundation, DFG).

#### § 1 Purpose of the Association

- (1) The DFG promotes research of the highest quality. The focus is on funding projects developed by the academic community itself in the area of knowledge-driven research. It funds research projects, creates competitive opportunities and conducts procedures for the review, evaluation, selection and decision of research proposals. The DFG helps shape the overall conditions and standards of academic research. It maintains dialogue with society, politics and business and supports the transfer of knowledge. It advises state institutions and institutions working in the public interest on issues relating to academic research and research policy.
- (2) The DFG acts in a research-driven manner in all its procedures. Excellent research requires a broad spectrum of ideas and pluralistic debate; for this reason, the DFG takes particular care to promote international cooperation, early career researchers, gender equality and diversity in science and the humanities.

#### § 11 Senate

- (1) The Senate is the central scientific body of the DFG. It deliberates and resolves, within the principles adopted by the General Assembly, on all major matters of the DFG, unless they are reserved for the Joint Committee.
- (2) The Senate determines which review boards are to be formed and how they are to be structured. In doing so it ensures that the review boards in all their forms and disciplines cover the full range of fields in science and the humanities and take due account of their disciplinary research interests and interdisciplinary relationships.
- (3) The Senate consists of 39 members.
- (4) 36 members are elected by the General Assembly based on a rolling system. Researchers who work at institutions of higher education or other research institutions are eligible for election. The General Assembly may also elect other persons, in consideration of certain expertise relevant to the DFG. Voting is based on the person; elected members of the Senate do not act as representatives of institutions. Adequate representation of the entire spectrum of research disciplines must be sought in the composition of the elected members. The Senate may invite guests to its meetings on a permanent or occasional basis.
- (5) The ex officio members of the Senate are the respective President of the German Rectors' Conference, the Union of the German Academies of Sciences and Humanities and the Max Planck Society. Members of the Senate by virtue of their office may be represented at meetings by other authorised representatives of their respective institutions to be appointed in advance.
- (6) The term of office of the elected members of the Senate is three years. It begins on the first day of the calendar year following the election. Re-election for a second term is possible. If an elected member of the Senate retires during their term of office, the Senate may co-opt a substitute member from previous lists of nominees for the remainder of the term of office of the retiring member. For the elections, the Executive Committee, acting on proposals received from the members of the DFG and with the involvement of the Senate, prepares slates of nominations, which as a rule comprise three names for each vacant seat. Details are governed by rules of procedure to be determined by the General Assembly.
- (7) Meetings of the Senate are convened by the President. He or she must convene the Senate at the request of at least one-third of its members.
- (8) Within its mandate, the Senate may establish committees and commissions whose members need not be members of the Senate

II.

The following principles apply for the Constitution and Procedure of the Permanent Senate Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area:

(1) The Senate has assigned to the Deutsche Forschungsgemeinschaft's Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area the responsibility of investigating the scientific foundations for the protection of workers' health from the effects of toxic chemicals at the workplace. The most important practical results

of the Commission's work are scientific recommendations for the establishment of MAK and BAT values, for the classification of carcinogenic substances and for the evaluation of embryotoxic and/or foetotoxic effects and of germ cell mutagens as well as the investigation and evaluation of analytical methods for controlling exposure and for examining observance of limit values for health protection at the workplace. In addition, the Commission investigates further current problems of hazards to health caused by occupational exposures and proposes possible appropriate solutions.

A two-step procedure appears to be the best solution for the realization of health protection measures at the workplace which are in line with the current state of the science: The results of the Commission's work already mentioned above are annually reviewed and published by the Deutsche Forschungsgemeinschaft. At the same time they are handed to the Bundesminister für Arbeit und Soziales who examines the recommendations, also taking nonscientific viewpoints into account, and who then makes them legally binding in an appropriate form – altered or unaltered – as a basis for health protection.

- (2) The Commission works in scientific freedom and independence. It is not subject to instructions regarding selection or priority setting for the examination of substances and other matters to be investigated. It is the Commission's duty, however, to take up suggestions, in so far as they are of scientific significance, from industrial users and as far as possible to treat with precedence suggestions from the Bundesminister für Arbeit und Soziales who is responsible for health protection at the workplace.
- (3) The complete transparency of the Commission's work programme is guaranteed by means of the advance announcement of planned changes and additions on the homepage of the Commission at the DFG. A most comprehensive information basis for the Commission's recommendations is ensured by the request to supply the Commission with information and commentaries and the associated possibility of involving appropriate scientific experts in the decision-making process.

The derivation of MAK and BAT values and the classification of carcinogenic substances or substances suspected of having carcinogenic potential and the evaluation of embryotoxic and/or foetotoxic effects and germ cell mutagens are published in the form of detailed scientific documentations ("Begründungen").

- (4) The sole object of the Commission's work is to protect, as far as possible and necessary, and in line with the most up to date scientific information, the health of workers and of their offspring. The Commission regards health as the highest value which it does not weigh up against other factors. Therefore, only scientific arguments regarding health at the workplace are considered in discussions and decision-making. Other aspects such as sociopolitical, economic, technological and other non-substance-related considerations are excluded.
- (5) For the reasons stated in 4., requests for participation of experts, other than those concerned with health aspects of protection at work, in the Commission's discussions cannot be complied with.
- (6) At the same time the Commission does not undervalue the necessity for political decisions in the process of realizing protection at work. It does, however, reject mixing political with scientific judgements in its own work.
- (7) By publishing its recommendations, the Commission contributes to fulfilling the constitutional obligation of the Deutsche Forschungsgemeinschaft to provide advice on scientific matters to parliaments and public authorities. Should the Bundesministerium für Arbeit und Soziales (see 1. above) deviate in any particular case from the recommendations, the Commission considers it essential that it makes the reasons known.
- (8) The presidency and governing body of the Deutsche Forschungsgemeinschaft can check observance of the rules of procedure, but ensure unchanged and immediate publication of the Commission's results, in so far as there are no imperative opposing reasons.

#### III.

Newly appointed Members and Permanent Guest Contributors of the Permanent Senate Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area receive written notice from the President of the Deutsche Forschungsgemeinschaft in which the following fundamentals of the Commission's work are laid down:

In order to fulfil the statutory functions of the Deutsche Forschungsgemeinschaft as advisers to the legislative and executive organs, the Senate has set up Commissions for various fields of knowledge, for example, for protection at work, protection of health and protection of the environment. The Commission in which you have been appointed is one of these.

The Commissions have the responsibility of ascertaining the current state of scientific data available in the respective field and of formulating it in such a way that the government authorities to be advised are in a position to reach competent decisions on their own responsibility. To this end it is desirable that in the individual Commissions the scientific position is elaborated so that it can be upheld by all members. Such a consensus is then represented in public as the standpoint of the Deutsche Forschungsgemeinschaft.

In view of this responsibility of the Commission, scientists are appointed members ad personam in their capacity as authoritative experts and not as representatives of the institutions or companies in which they work.

As well as these members there are also permanent guest contributors working in the Commissions. Scientists and other experts from public authorities are appointed permanent guest contributors with advisory function and may take on research assignments as well as official responsibilities. As they belong to institutes potentially affected by the Commission's advice they have no voting rights. In this way a possible conflict of interests should be avoided from the outset.

The Senate appoints the Commissions for periods of office lasting six years each. Members and permanent guest contributors are also appointed for six years and can be reappointed once. A further extension of a personal mandate is only possible in justified exceptional cases.

The strict division aimed at between recognition of a scientific standpoint and its "application" in the broadest sense, be it from the political, legal, economic or other social point of view, presupposes that extra-scientific problems of the government bodies the Commission is required to advise do not find admittance into the vote of the Commission. Political consequences of scientific facts, problems of realization, decisions about the reasonableness of particular risks, economic aspects, etc, do not belong within the responsibility of the Deutsche Forschungsgemeinschaft nor its Commissions.

For the procedure of the Commissions, discussions as well as data and facts referred to in the discussions are dealt with in strict confidentiality up until their publication by the Deutsche Forschungsgemeinschaft as a Report from the Commission concerned. Nobody, through appointment in a Commission, may gain a competitive advantage by exploiting advance information.

IV.

Procedure of the Commission for prospective new entries and changes to MAK values and Assessment Values in Biological Material

- 1. Prospective changes and new entries are announced one year in advance in the List of MAK and BAT Values, usually on 1st July. In addition, the new entries are published on the homepage of the Commission at the DFG (<a href="www.dfg.de/mak-ankuendigung">www.dfg.de/mak-ankuendigung</a>). If necessary, in addition to the regular updates each year in July, further announcements of prospective changes and new entries can be made there at any time. In the case of changes, the type of prospective change is reported and the reason for it. On announcement of the changes the Commission requests that relevant information and comments be received.
- 2. Completed substance evaluations in the Sections MAK Values and Assessment Values in Biological Material are listed in detail in the "Changes and New entries" of the List of MAK and BAT Values (Appendix page I) and published on the homepage of the Commission at the DFG (List of changes and new entries in German; <a href="www.dfg.de/mak-aenderungen">www.dfg.de/mak-aenderungen</a>). The Commission has approved these suggestions, but presents them for discussion for the period of six months. Until this date new data or scientific comments can be sent to the secretarial office of the Commission; these will be examined by the Commission and as far as is necessary taken into account for the final ratification.

List of changes and new entries of substances in the parts MAK values and classifications and assessment values in biological material reviewed in 2024/2025

## Part Assessment Values in Biological Material

## **Biological Tolerance Values (BAT values)**

★ Tetrahydrofuran [109-99-9]

1 mg tetrahydrofuran/l urine previous BAT value 2 mg/l

urine

**Biological Guidance Values (BLW)** 

**★** 1,3-Dichlorobenzene [541-73-1]

40 mg 3,5-dichlorocatechol/g creatinine no previous BLW

**Biological Reference Values (BAR)** 

**★** Aniline [62-53-3]

15 µg aniline (after hydrolysis)/l urine no previous BAR

**★** p-Chloroaniline [106-47-8]

 $1~\mu g$  p-chloroaniline (after hydrolysis)/l urine  $$\rm no~previous~BAR$$ 

★ Lithium compounds, inorganic (as Li [7439-93-2])

 $100~\mu g$  lithium/l urine previous BAR  $50~\mu g/l$  urine

Pregnancy Risk Groups at BAT value

★ Tetrahydrofuran [109-99-9] Group C

# Announcement list of substances being examined for the establishment of MAK values and assessment values in biological material

The "Permanent Senate Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area" of the Deutsche Forschungsgemeinschaft is discussing changes of, or additions to, the MAK values and classifications as well as assessment values in biological material of the following substances for the 2026 list (Report 62) and future subsequent lists:

Substance	Point of discussion	Reason
Acrylamide [79-06-1]	Re-evaluation of EKA	Suggestion from the Commission
Acrylates (monomers and oligomers)	Sensitizing effect	Suggestion from the Commission
Alkali chromates (Cr(VI) compounds)	Evaluation of BAR	Suggestion from the Commission
2-Amino-2-ethyl-1,3-propanediol [115-70-8]	MAK value	Suggestion from the Commission
Benzophenone [119-61-9]	MAK value, new entry	Suggestion from the Commission
Benzophenone-4 [4065-45-6]	MAK value, new entry	Suggestion from the Commission
Benzyltoluene [27776-01-8]	MAK value, new entry	Suggestion from the Commission
Bisphenol A (4,4'-Isopropylidenediphenol) [80-05-7]	MAK value	Suggestion from the Commission
	Re-evaluation of BLW	Suggestion from the Commission
1-Butanol [71-36-3]	Re-evaluation of BAT value	Suggestion from the Commission
2-Butoxyethanol [111-76-2]	Re-evaluation of BAT value	Suggestion from the Commission
	Evaluation of a Pregnancy Risk Group at BAT value	Suggestion from the Commission
4-tert-Butylbenzoic acid [98-73-7]	MAK value	Suggestion from the Commission
tert-Butyl hydroperoxide [75-91-2]	MAK value	Suggestion from the Commission
p-tert-Butylphenol [98-54-4]	MAK value	Suggestion from the Commission
Calcium sulfate (inhalable fraction) Anhydrite [7778-18-9] Hemihydrate [10034-76-1] Dihydrate [10101-41-4] Gypsum [13397-24-5]	MAK value	Suggestion from the Commission
Carbon dioxide [124-38-9]	MAK value	Suggestion from the Commission
Carbon disulfide [75-15-0]	Evaluation of a Pregnancy Risk Group at BAT value	Suggestion from the Commission
Chlorpromazine (2-chloro-10-(3-dimethylamino-propyl)phenothiazine) [50-53-3]	MAK value	Suggestion from the Commission
Chromium(III) compounds	MAK value	Suggestion from the Commission
Cobalt [7440-48-4] and cobalt compounds	Re-evaluation of BLW	Suggestion from the Commission
Dibenzyltoluene	MAK value, new entry	Suggestion from the Commission
1,2-Dichloroethylene sym [540-59-0] (cis [156-59-2] and trans [156-60-5])	MAK value	Suggestion from the Commission
Dichloromethane [75-09-2]	Carcinogenic effect	Suggestion from the Commission
2,2-Dichloropropionic acid [75-99-0]	MAK value	Suggestion from the Commission
Diethyl carbonate [105-58-8]	MAK value	Suggestion from the Commission
Diisononyl phthalate [28553-12-0]	MAK value, new entry	Suggestion from the Commission
N,N-Dimethylaniline [121-69-7]	Re-evaluation of the Pregnancy Risk Group at MAK value	Suggestion from the Commission
	MAK value	Suggestion from the Commission
Dimethyl carbonate [616-38-6]	MAK value	Suggestion from the Commission
N,N-Dimethyl-n-propylamine [926-63-6]	MAK value, new entry	Suggestion from users

Substance	Point of discussion	Reason
Dimethyl sulfate [77-78-1]	Re-evaluation of assessment values in biological material	Suggestion from the Commission
Dipropylene glycol monomethyl ether [34590-94-8] (mixture of isomers)	MAK value	Suggestion from the Commission
Dust, general limit value (inhalable fraction)	MAK value	Suggestion from the Commission
Ethylene carbonate [96-49-1]	MAK value	Suggestion from the Commission
Ethylene thiourea (imidazoline-2-thione) [96-45-7]	Evaluation of assessment values in biological material	Suggestion from the Commission
Ethyl methyl carbonate [623-53-0]	MAK value	Suggestion from the Commission
N-Ethyl-2-pyrrolidone [2687-91-4]	Evaluation of assessment values in biological material	Suggestion from the Commission
Fluranes (desflurane, enflurane, isoflurane, sevoflurane)	MAK value	Suggestion from the Commission
	Evaluation of assessment values in biological material	Suggestion from the Commission
Graphene [1034343-98-0]	MAK value, new entry	Suggestion from the Commission
	Carcinogenic effect, new entry	Suggestion from the Commission
Halothane [151-67-7]	MAK value	Suggestion from the Commission
n-Hexane [110-54-3]	Re-evaluation of BAT value	Suggestion from the Commission
	Evaluation of a Pregnancy Risk Group at BAT value	Suggestion from the Commission
2-Hexanone [591-78-6]	MAK value	Suggestion from the Commission
	Re-evaluation of BAT value	Suggestion from the Commission
	Evaluation of a Pregnancy Risk Group at BAT value	Suggestion from the Commission
Hydrazoic acid [7782-79-8]	MAK value	Suggestion from the Commission
Iodomethane [74-88-4]	Carcinogenic effect	Suggestion from the Commission
Isophorone diisocyanate [4098-71-9]	MAK value	Suggestion from the Commission
Lithium compounds, inorganic (as Li [7439-93-2])	Re-evaluation of assessment values in biological material	Suggestion from the Commission
Manganese [7439-96-5] and its inorganic compounds (respirable fraction)	MAK value	Suggestion from AGS
Manganese [7439-96-5] and its inorganic compounds	Re-evaluation of assessment values in biological material	Suggestion from the Commission
Melamine [108-78-1]	MAK value, new entry	Suggestion from the Commission
	Carcinogenic effect, new entry	Suggestion from the Commission
	Evaluation of assessment values in biological material	Suggestion from the Commission
2-Mercaptobenzothiazole [149-30-4]	Evaluation of assessment values in biological material	Suggestion from the Commission
Mercury, organic compounds	Carcinogenic effect	Suggestion from the Commission
Metal-working fluids	Toxicity and carcinogenic effect	see Section Xc
Methyl isocyanate [624-83-9]	MAK value	Suggestion from the Commission
4-Methyl-2-pentanone (Methyl isobutyl ketone) [108-10-1]	Re-evaluation of assessment values in biological material	Suggestion from the Commission
N-Methyl-2-pyrrolidone [872-50-4]	Re-evaluation of BAT value	Suggestion from the Commission
Molybdenum [7439-98-7] and its compounds	Re-evaluation of BAR	Suggestion from the Commission
Molybdenum disulfide [1317-33-5]	MAK value, new entry	Suggestion from the Commission

Substance	Point of discussion	Reason
1,5-Naphthylene diisocyanate [3173-72-6]	MAK value	Suggestion from the Commission
Nickel carbonyl [13463-39-3]	MAK value, new entry	Suggestion from the Commission
Pentachlorophenol [87-86-5]	Carcinogenic effect	Suggestion from the Commission
Perfluorooctanesulfonic acid (PFOS) [1763-23-1] and its salts	MAK value	Suggestion from the Commission
	Re-evaluation of BAT value	Suggestion from the Commission
Perfluorooctanoic acid (PFOA) [335-67-1] and its salts	MAK value	Suggestion from the Commission
	Re-evaluation of BAT value	Suggestion from the Commission
Phenol [108-95-2]	Re-evaluation of BLW	Suggestion from the Commission
2-Phenoxyethanol [122-99-6]	Evaluation of assessment values in biological material	Suggestion from the Commission
p-Phenylenediamine [106-50-3]	MAK value	Suggestion from the Commission
Pyrethrum and pyrethroids	Re-evaluation of assessment values in biological material	Suggestion from the Commission
Quartz [14808-60-7]	MAK value	Suggestion from the Commission
Selenium [7782-49-2] and its inorganic compounds (as Se)	MAK value	Suggestion from the Commission
	Evaluation of a Pregnancy Risk Group at BAT value	Suggestion from the Commission
Silica, amorphous: b) quartz glass [60676-86-0], fused silica [60676-86-0], silica fume (calcined) [69012-64-2], diatomaceous earth [68855-54-9]	MAK value	Suggestion from the Commission
	Carcinogenic effect	Suggestion from the Commission
Sodium azide [26628-22-8]	MAK value	Suggestion from the Commission
Soya bean constituents	MAK value	Suggestion from the Commission
Strontium [7440-24-6]	Evaluation of assessment values in biological material	Suggestion from the Commission
Styrene [100-42-5]	Re-evaluation of BAT value	Suggestion from the Commission
	Evaluation of a Pregnancy Risk Group at BAT value	Suggestion from the Commission
Sulfur [7704-34-9]	MAK value	Suggestion from the Commission
p-Toluenesulfonic acid [104-15-4]	MAK value, new entry	Suggestion from the Commission
Tributyl phosphate [126-73-8]	Percutaneous absorption	Suggestion from the Commission
Trimethylbenzene (all isomers) [25551-13-7]: 1,2,3-Trimethylbenzene [526-73-8], 1,2,4-Trimethylbenzene [95-63-6], 1,3,5-Trimethylbenzene [108-67-8]	Re-evaluation of BAT value	Suggestion from the Commission
Zinc [7440-66-6] and its inorganic compounds (inhalable fraction)	MAK value	Suggestion from AGS

This announcement list is also published in German language on the homepage of the Commission at the DFG: <a href="https://www.dfg.de/mak-ankuendigung">https://www.dfg.de/mak-ankuendigung</a>. In addition to the regular updates each year in July, further announcements of prospective changes and new entries can be made there at any time.

The Commission requests that company physicians, the manufacturers and users of industrial chemicals, research institutes dealing with these compounds, as well as boards of control and other governmental institutions, submit the names of any additional substances which occur at the workplace and have not as yet been considered.

Scientific and technical data and information applying to the compounds listed above should be submitted by

1st February 2026

to the

Geschäftsstelle der Deutschen Forschungsgemeinschaft 53170 Bonn

Prof. Dr. A. Hartwig

Chair of the Permanent Senate Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area
